BNO055

INTELLIGENT ABSOLUTE ORIENTATION SENSOR, 9-AXIS SENSOR FUSION ALL-IN-ONE WINDOWS 8.x COMPLIANT SENSOR HUB

Basic Description

Key features:

- Outputs fused sensor data   Quaternion, Euler angles, Rotation vector, Linear acceleration, Gravity, Heading
- 3 sensors in one device   an advanced triaxial 16bit gyroscope, a versatile, leading edge triaxial 14bit accelerometer and a full performance geomagnetic sensor
- Small package   LGA package 28 pins
Footprint 3.8 x 5.2 mm², height 1.13 mm²
- Power Management   Intelligent Power Management: normal, low power and suspend mode available
- Common voltage supplies V_{DD} voltage range: 2.4V to 3.6V
- Digital interface   HID-I2C (Windows 8 compatible), I²C, UART
V_{DDIO} voltage range: 1.7V to 3.6V
- Consumer electronics suite   MSL1, RoHS compliant, halogen-free
Operating temperature: -40°C ... +85°C

Key features of integrated sensors:

Accelerometer features

- Programmable functionality   Acceleration ranges ±2g/±4g/±8g/±16g
Low-pass filter bandwidths 1kHz - <8Hz
Operation modes:
    - Normal
    - Suspend
    - Low power
    - Standby
    - Deep suspend
- On-chip interrupt controller   Motion-triggered interrupt-signal generation for
    - any-motion (slope) detection
    - slow or no motion recognition
    - high-g detection

Gyroscope features

- Programmable functionality

  Ranges switchable from ±125°/s to ±2000°/s
  Low-pass filter bandwidths 523Hz - 12Hz
  Operation modes:
  - Normal
  - Fast power up
  - Deep suspend
  - Suspend
  - Advanced power save

- On-chip interrupt controller

  Motion-triggered interrupt-signal generation for
  - any-motion (slope) detection
  - high rate

Magnetometer features

- Flexible functionality

  Magnetic field range typical ±1300µT (x-, y-axis);
  ±2500µT (z-axis)
  Magnetic field resolution of ~0.3µT
  Operating modes:
  - Low power
  - Regular
  - Enhanced regular
  - High Accuracy
  Power modes:
  - Normal
  - Sleep
  - Suspend
  - Force

Typical applications

- Navigation
- Robotics
- Fitness and well-being
- Augmented reality
- Context awareness
- Tablets and ultra-books

General description

The BNO055 is a System in Package (SiP), integrating a triaxial 14-bit accelerometer, a triaxial 16-bit gyroscope with a range of ±2000 degrees per second, a triaxial geomagnetic sensor and a 32-bit cortex M0+ microcontroller running Bosch Sensortec sensor fusion software, in a single package.

The corresponding chip-sets are integrated into one single 28-pin LGA 3.8mm x 5.2mm x 1.1 mm housing. For optimum system integration the BNO055 is equipped with digital bi-directional I^{2}C and UART interfaces. The I^{2}C interface can be programmed to run with the HID-I2C protocol turning the BNO055 into a plug-and-play sensor hub solution for devices running the Windows 8.0 or 8.1 operating system.

Power Supply Rejection Rate	$PSRR_m$	T_A=25°C Nominal V_{DD} supplies		±0.5		µT/V

2. **Absolute Maximum Ratings**

Table 2-1: Absolute maximum ratings

Parameter	Symbol	Condition	Min	Max	Units
Voltage at Supply Pin	V_{DD} Pin		-0.3	4.2	V
	V_{DDIO} Pin		-0.3	3.6	V
Voltage at any Logic Pin	$V_{non-supply}$ Pin		-0.3	$V_{DDIO}+0.3$	V
Passive Storage Temp. Range	Trps	≤ 65% rel. H.	-50	+150	°C
Mechanical Shock	MechShock$_{200\mu s}$	Duration ≤ 200µs		10,000	g
	MechShock$_{1ms}$	Duration ≤ 1.0ms		2,000	g
	MechShock$_{freefall}$	Free fall onto hard surfaces		1.8	m
ESD	ESD$_{HBM}$	HBM, at any Pin		2	kV
	ESD$_{CDM}$	CDM		500	V
	ESD$_{MM}$	MM		200	V
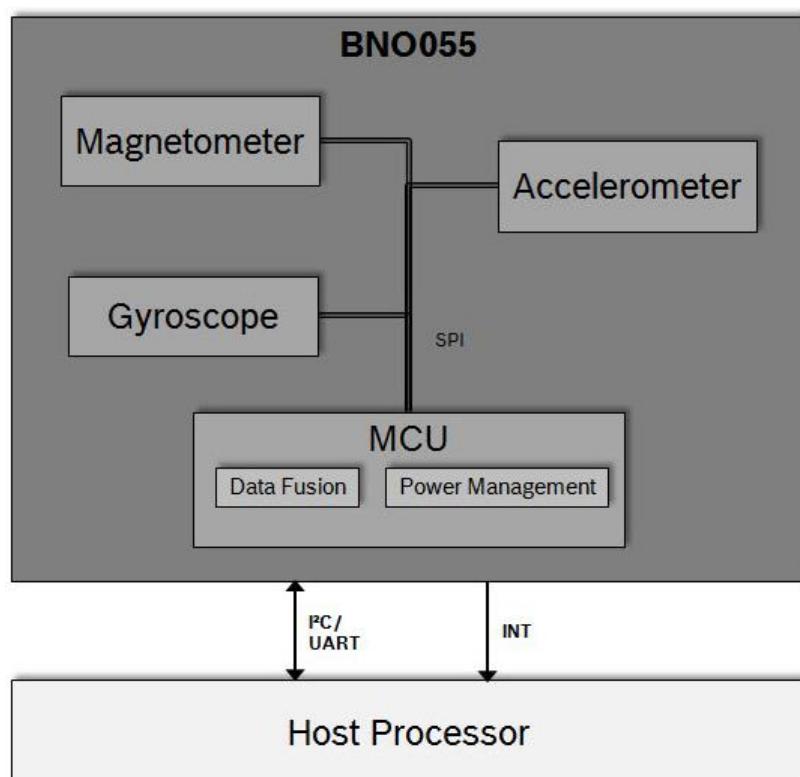

Note:
Stress above these limits may cause damage to the device. Exceeding the specified electrical limits may affect the device reliability or cause malfunction.

3. **Functional Description**

3.1 Architecture

The following figure shows the basic building blocks of the BNO055 device.

Figure 1: system architecture

3.2 Power management

The BNO055 has two distinct power supply pins:
• V_{DD} is the main power supply for the internal sensors
• V_{DDIO} is a separate power supply pin used for the supply of the µC and the digital interfaces

For the switching sequence of power supply V_{DD} and V_{DDIO} it is mandatory that V_{DD} is powered on and driven to the specified level before or at the same time as V_{DDIO} is powered ON. Otherwise there are no limitations on the voltage levels of both pins relative to each other, as long as they are used within the specified operating range.

The sensor features a power-on reset (POR), initializing the register map with the default values and starting in CONFIG mode. The POR is executed at every power on and can also be triggered either by applying a low signal to the nRESET pin for at least 20ns or by setting the RST_SYS bit in the SYS_TRIGGER register.

The BNO055 can be configured to run in one of the following power modes: normal mode, low power mode, and suspend mode. These power modes are described in more detail in section Power Modes

Power Modes

The BNO055 support three different power modes: Normal mode, Low Power Mode, and Suspend mode.

The power mode can be selected by writing to the PWR_MODE register as defined in the table below. As default at start-up the BNO055 will run in Normal mode.

Table 3-1: power modes selection

Parameter	Value	[Reg Addr]: Reg Value
Power Mode	Normal Mode	[PWR_MODE]: xxxxxx00b
	Low Power Mode	[PWR_MODE]: xxxxxx01b
	Suspend Mode	[PWR_MODE]: xxxxxx10b
	Invalid	[PWR_MODE]: xxxxxx11b

It is recommended not to configure the invalid power mode, writing multiple register along with PWR_MODE register and no specific value is guaranteed when read.

3.2.1 Normal Mode

In normal mode all sensors required for the selected operating mode (see section 3.3) are always switched ON. The register map and the internal peripherals of the MCU are always operative in this mode.

3.2.2 Low Power Mode

If no activity (i.e. no motion) is detected for a configurable duration (default 5 seconds), the BNO055 enters the low power mode. In this mode only the accelerometer is active. Once motion is detected (i.e. the accelerometer signals an any-motion interrupt), the system is woken up and normal mode is entered. The following settings are possible.

Table 3-2: Low power modes - Interrupts

Description	Parameter	Value	Reg Value	Restriction
Entering to sleep: NO Motion Interrupt	Detection Type	No Motion	[ACC_NM_SET] : xxxxxxx1b	n/a
		Detection Axis	[ACC_INT_Settings] : bit4-bit2	Shares common bit with Any Motion interrupt axis selection
	Params	Duration	[ACC_NM_SET] : bit6-bit1	n/a
		Threshold	[ACC_NM_THRE] : bit7-bit0	n/a

Description	Parameter	Value	Reg Value
Waking up: Any Motion Interrupt	Detection Type	Detection Axis	[ACC_INT_Settings] : bit4-bit2
	Params	Duration	[ACC_INT_Settings] : bit1-bit0
		Threshold	[ACC_AM_THRES] : bit7-bit0

Additionally, the interrupt pins can also be configured to provide HW interrupt to the host.

The BNO055 is by default configured to have optimum values for entering into sleep and waking up. To restore these values, trigger system reset by setting RST_SYS bit in SYS_TRIGGER register.

There are some limitations to achieve the low power mode performance:

- Only No and Any motion interrupts are applicable and High-G and slow motion interrupts are not applicable in low power mode.
- Low power mode is not applicable where accelerometer is not employed.

3.2.3 Suspend Mode

In suspend mode the system is paused and all the sensors and the microcontroller are put into sleep mode. No values in the register map will be updated in this mode. To exit from suspend mode the mode should be changed by writing to the PWR_MODE register (see Table 3-1).

3.3 Operation Modes

The BNO055 provides a variety of output signals, which can be chosen by selecting the appropriate operation mode. The table below lists the different modes and the available sensor signals.

Table 3-3: Operating modes overview

Operating Mode		Available sensor signals			Fusion Data	
		Accel	Mag	Gyro	Relative orientation	Absolute orientation
	CONFIGMODE	-	-	-	-	-
Non-fusionmodes	ACCONLY	X	-	-	-	-
	MAGONLY	-	X	-	-	-
	GYROONLY	-	-	X	-	-
	ACCMAG	X	X	-	-	-
	ACCGYRO	X	-	X	-	-
	MAGGYRO	-	X	X	-	-
	AMG	X	X	X	-	-
Fusion modes	IMU	X	-	X	X	-
	COMPASS	X	X	-	-	X
	M4G	X	X	-	X	-
	NDOF_FMC_OFF	X	X	X	-	X
	NDOF	X	X	X	-	X

The default operation mode after power-on is CONFIGMODE.

When the user changes to another operation mode, the sensors which are required in that particular sensor mode are powered, while the sensors whose signals are not required are set to suspend mode.

The BNO055 sets the following default settings for the sensors. The user can overwrite these settings in the register map when in CONFIGMODE.

Table 3-4: Default sensor settings

Sensor	Range	Bandwidth
Accelerometer	4G	62.5 Hz
Magnetometer	NA	10 Hz
Gyroscope	2000 dps	32 Hz

In any mode, the sensor data are available in the data register based on the unit selected. The axis of the data is configured based on the axis-remap register configuration.

The operating mode can be selected by writing to the OPR_MODE register, possible register values and the corresponding operating modes are shown in the table below.

Table 3-5: operating modes selection

Parameter	Value	[Reg Addr]: Reg Value
CONFIG MODE	CONFIGMODE	[OPR_MODE]: xxxx0000b
Non-Fusion Mode	ACCONLY	[OPR_MODE]: xxxx0001b
	MAGONLY	[OPR_MODE]: xxxx0010b
	GYROONLY	[OPR_MODE]: xxxx0011b
	ACCMAG	[OPR_MODE]: xxxx0100b
	ACCGYRO	[OPR_MODE]: xxxx0101b
	MAGGYRO	[OPR_MODE]: xxxx0110b
	AMG	[OPR_MODE]: xxxx0111b
Fusion Mode	IMU	[OPR_MODE]: xxxx1000b
	COMPASS	[OPR_MODE]: xxxx1001b
	M4G	[OPR_MODE]: xxxx1010b
	NDOF_FMC_OFF	[OPR_MODE]: xxxx1011b
	NDOF	[OPR_MODE]: xxxx1100b

Table 3-6 below shows the time required to switch between CONFIGMODE and the other operating modes.

Table 3-6: Operating mode switching time

From	To	Switching time
CONFIGMODE	Any operation mode	7ms
Any operation mode	CONFIGMODE	19ms

3.3.1 Config Mode

This mode is used to configure BNO, wherein all output data is reset to zero and sensor fusion is halted. This is the only mode in which all the writable register map entries can be changed. (Exceptions from this rule are the interrupt registers (INT and INT_MSK) and the operation mode register (OPR_MODE), which can be modified in any operation mode.)

As being said, this mode is the default operation mode after power-on or RESET. Any other mode must be chosen to be able to read any sensor data.

3.3.2 Non-Fusion Modes

3.3.2.1 ACCONLY

If the application requires only raw accelerometer data, this mode can be chosen. In this mode the other sensors (magnetometer, gyro) are suspended to lower the power consumption. In this mode, the BNO055 behaves like a stand-alone acceleration sensor.

3.3.2.1 MAGONLY

In MAGONLY mode, the BNO055 behaves like a stand-alone magnetometer, with acceleration sensor and gyroscope being suspended.

3.3.2.2 GYROONLY

In GYROONLY mode, the BNO055 behaves like a stand-alone gyroscope, with acceleration sensor and magnetometer being suspended.

3.3.2.3 ACCMAG

Both accelerometer and magnetometer are switched on, the user can read the data from these two sensors.

3.3.2.4 ACCGYRO

Both accelerometer and gyroscope are switched on; the user can read the data from these two sensors.

3.3.2.5 MAGGYRO

Both magnetometer and gyroscope are switched on, the user can read the data from these two sensors.

3.3.2.6 AMG (ACC-MAG-GYRO)

All three sensors accelerometer, magnetometer and gyroscope are switched on.

3.3.3 Fusion modes

Sensor fusion modes are meant to calculate measures describing the orientation of the device in space. It can be distinguished between non-absolute or relative orientation and absolute orientation. Absolute orientation means orientation of the sensor with respect to the earth and its magnetic field. In other words, absolute orientation sensor fusion modes calculate the direction of the magnetic north pole.
In non-absolute or relative orientation modes, the heading of the sensor can vary depending on how the sensor is placed initially.

All fusion modes provide the heading of the sensor as quaternion data or in Euler angles (roll, pitch and yaw angle). The acceleration sensor is both exposed to the gravity force and to accelerations applied to the sensor due to movement. In fusion modes it is possible to separate the two acceleration sources, and thus the sensor fusion data provides separately linear acceleration (i.e. acceleration that is applied due to movement) and the gravity vector.

For all Fusion modes, the sensors are configured with the default settings as defined in Table 3-7: Default sensor configuration at power-on in Chapter 3.5.1.

Note 1: The sensor fusion algorithm performs automatic background calibration of all sensors. This feature cannot be disabled.

Note 2: The sensor fusion algorithm uses the accelerometer data to compensate for the gyroscope drift over time. When the device is in motion, the accelerometer data is temporarily ignored and the fusion relies on the gyroscope for pitch and roll. If the accelerometer data cannot be used for an extended period of time (e.g. due to vibration, or to constant movement), then this may cause the pitch and roll values to drift over time. Likewise, if the magnetometer data is detected to be distorted, it will automatically be ignored by the algorithm and this may cause the heading to drift over time (as in IMU mode).

Note 3: The sensor fusion algorithm was primarily designed to track human motion. If the device is subjected to large accelerations for an extended period of time (e.g. in a vehicle cornering at high speed or braking over a long distance), the device may incorrectly interpret this large acceleration as the gravity vector. For applications where the sensor may be exposed to significant velocities, it is recommended to test the device for the specific use-case.

3.3.3.1 IMU (Inertial Measurement Unit)

In the IMU mode the relative orientation of the BNO055 in space is calculated from the accelerometer and gyroscope data. The calculation is fast (i.e. high output data rate).

3.3.3.2 COMPASS

The COMPASS mode is intended to measure the magnetic earth field and calculate the geographic direction.
The earth magnetic field is a vector with the horizontal components x,y and the vertical z component. It depends on the position on the globe and natural iron occurrence. For heading calculation (direction of compass pointer) only the horizontal components x and y are used. Therefore the vector components of the earth magnetic field must be transformed in the horizontal plane, which requires the knowledge of the direction of the gravity vector. To summarize, the heading can only be calculated when considering gravity and magnetic field at the same time.

However, the measurement accuracy depends on the stability of the surrounding magnetic field. Furthermore, since the earth magnetic field is usually much smaller than the magnetic fields that occur around and inside electronic devices, the compass mode requires calibration (see chapter 3.10)

3.3.3.3 M4G (Magnet for Gyroscope)

The M4G mode is similar to the IMU mode, but instead of using the gyroscope signal to detect rotation, the changing orientation of the magnetometer in the magnetic field is used. Since the magnetometer has much lower power consumption than the gyroscope, this mode is less power consuming in comparison to the IMU mode. There are no drift effects in this mode which are inherent to the gyroscope.

However, as for compass mode, the measurement accuracy depends on the stability of the surrounding magnetic field.
For this mode no magnetometer calibration is required and also not available.

3.3.3.4 NDOF_FMC_OFF

This fusion mode is same as NDOF mode, but with the Fast Magnetometer Calibration turned 'OFF'.

3.3.3.5 NDOF

This is a fusion mode with 9 degrees of freedom where the fused absolute orientation data is calculated from accelerometer, gyroscope and the magnetometer. The advantages of combining all three sensors are a fast calculation, resulting in high output data rate, and high robustness from magnetic field distortions. In this mode the Fast Magnetometer calibration is turned ON and thereby resulting in quick calibration of the magnetometer and higher output data accuracy. The current consumption is slightly higher in comparison to the NDOF_FMC_OFF fusion mode.

3.4 Axis remap

The device mounting position should not limit the data output of the BNO055 device. The axis of the device can be re-configured to the new reference axis.

Axis configuration byte: Register Address: **AXIS_MAP_CONFIG**

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved		Remapped Z axis value		Remapped Y axis value		Remapped X axis value	

There are two bits are used to configure the axis remap which will define in the following way,

Value	Axis Representation
00	X - Axis
01	Y - Axis
10	Z- Axis
11	Invalid
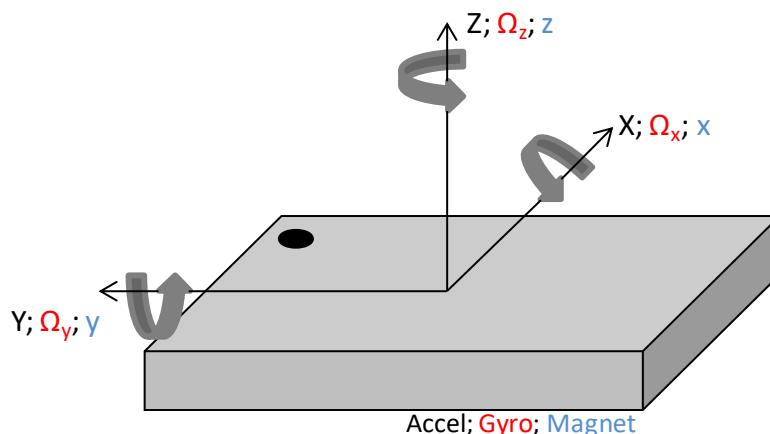

Also, when user try to configure the same axis to two or more then BNO055 will take this as invalid condition and previous configuration will be restored in the register map. The default value is: X Axis = X, Y Axis = Y and Z Axis = Z (AXIS_REMAP_CONFIG = 0x24).

Axis sign configuration byte: Register Address: **AXIS_MAP_SIGN**

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved					Remapped X axis sign	Remapped Y axis sign	Remapped Z axis sign

Value	Sign
0	Positive
1	Negative
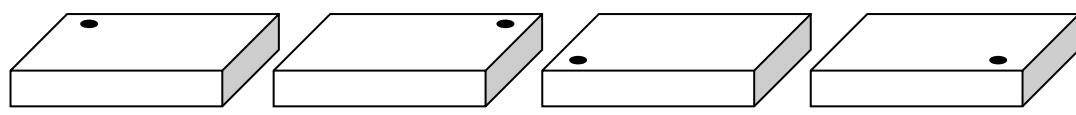

The default value is 0x00.

The default values correspond to the following coordinate system

Accel; Gyro; Magnet
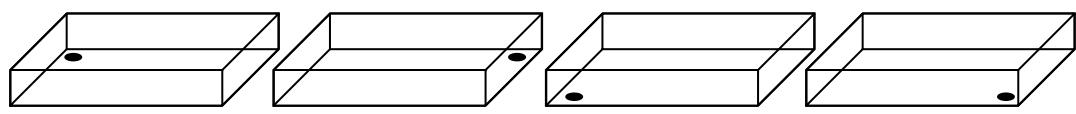

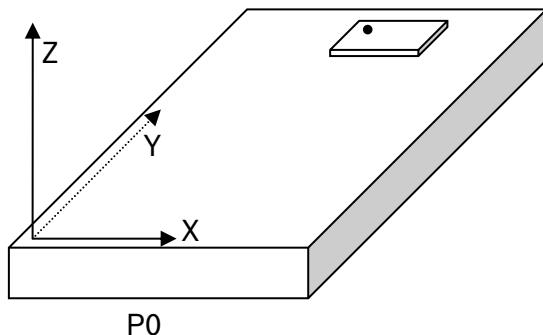

Some example placement for axis vs. register settings:

TOP VIEW

BOTTOM VIEW

P0

For the above described placements, following would be the axis configuration parameters.

Placement	AXIS_REMAP_CONFIG	AXIS_REMAP_SIGN
P0	0x21	0x04
P1 (default)	0x24	0x00
P2	0x24	0x06
P3	0x21	0x02
P4	0x24	0x03
P5	0x21	0x01
P6	0x21	0x07
P7	0x24	0x05

3.5 Sensor Configuration

The fusion outputs of the BNO055 are tightly linked with the sensor configuration settings. Due to this fact, the sensor configuration is limited when BNO055 is configured to run in any of the fusion operating mode. In any of the non-fusion modes the configuration settings can be updated by writing to the configuration registers as defined in the following sections.

3.5.1 Default sensor configuration

In fusion modes, the sensors settings are controlled by the BNO055 and configured as defined in Table 3-7. In non-fusion modes, the sensor settings can be configured by the user while in CONFIG_MODE are retained.

Table 3-7: Default sensor configuration at power-on

Sensors	Parameters	Value
Accelerometer	Power Mode	NORMAL
	Range	+/- 4g
	Bandwidth	62.5Hz
	Resolution	14 bits
Gyroscope	Power Mode	NORMAL
	Range	2000 °/s
	Bandwidth	32Hz
	Resolution	16 bits
Magnetometer	Power Mode	FORCED
	ODR	20Hz
	XY Repetition	15
	Z Repetition	16
	Resolution x/y/z	13/13/15 bits

3.5.2 Accelerometer configuration

The fusion outputs of the BNO055 are tightly linked with the accelerometer sensor settings. Therefore the configuration possibilities are restricted when running in any of the fusion operating modes. The accelerometer configuration can be changed by writing to the ACC_Config register, Table below shows different Accelerometer configurations

Table 3-8: Accelerometer configurations

Parameter	Values	[Reg Addr]: Reg Value	Restrictions
G Range	2G	[ACC_Config]: xxxxxx00b	
	4G	[ACC_Config]: xxxxxx01b	
	8G	[ACC_Config]: xxxxxx10b	
	16G	[ACC_Config]: xxxxxx11b	
Bandwidth	7.81Hz	[ACC_Config]: xxx000xxb	
	15.63Hz	[ACC_Config]: xxx001xxb	
	31.25Hz	[ACC_Config]: xxx010xxb	
	62.5Hz	[ACC_Config]: xxx011xxb	
	125Hz	[ACC_Config]: xxx100xxb	Auto controlled in fusion mode
	250Hz	[ACC_Config]: xxx101xxb	
	500Hz	[ACC_Config]: xxx110xxb	
	1000Hz	[ACC_Config]: xxx111xxb	
Operation Mode	Normal	[ACC_Config]: 000xxxxxb	
	Suspend	[ACC_Config]: 001xxxxxb	
	Low Power 1	[ACC_Config]: 010xxxxxb	
	Standby	[ACC_Config]: 011xxxxxb	
	Low Power 2	[ACC_Config]: 100xxxxxb	
	Deep Suspend	[ACC_Config]: 101xxxxxb	

The accelerometer sensor operation mode is not configurable by user when BNO power mode is configured as low power mode. BNO rewrites the user configured value to Normal mode when switching from config mode to any BNO operation mode. This used to achieve the BNO low power mode performance.

3.5.3 Gyroscope configuration

The fusion outputs of the BNO055 are tightly linked with the angular rate sensor settings. Therefore the configuration possibilities are restricted when running in any of the fusion operating modes. The gyroscope configuration can be changed by writing to the GYR_Config register, Table below shows different Gyroscope configurations

Table 3-9: Gyroscope configurations

Parameter	Values	[Reg Addr]: Register value	Restrictions
Range	2000 dps	[GYR_Config_0]: xxxxx000b	
	1000 dps	[GYR_Config_0]: xxxxx001b	
	500dps	[GYR_Config_0]: xxxxx010b	
	250 dps	[GYR_Config_0]: xxxxx011b	
	125 dps	[GYR_Config_0]: xxxxx100b	
Bandwidth	523Hz	[GYR_Config_0]: xx000xxxb	
	230Hz	[GYR_Config_0]: xx001xxxb	
	116Hz	[GYR_Config_0]: xx010xxxb	
	47Hz	[GYR_Config_0]: xx011xxxb	Auto controlled in fusion mode
	23Hz	[GYR_Config_0]: xx100xxxb	
	12Hz	[GYR_Config_0]: xx101xxxb	
	64Hz	[GYR_Config_0]: xx110xxxb	
	32Hz	[GYR_Config_0]: xx111xxxb	
Operation Mode	Normal	[GYR_Config_1]: xxxxx000b	
	Fast Power up	[GYR_Config_1]: xxxxx001b	
	Deep Suspend	[GYR_Config_1]: xxxxx010b	
	Suspend	[GYR_Config_1]: xxxxx011b	
	Advanced Powersave	[GYR_Config_1]: xxxxx100b	

3.5.4 Magnetometer configuration

The fusion outputs of the BNO055 are tightly linked with the magnetometer sensor settings. Therefore the configuration possibilities are restricted when running in any of the fusion operating modes. The magnetometer configuration can be changed by writing to the MAG_Config register, Table below shows different Magnetometer configurations.

Table 3-10: Magnetometer configurations

Parameter	Values	[Reg Addr]: Register value	Restrictions
Data output rate	2Hz	[MAG_Config]: xxxxx000b	
	6Hz	[MAG_Config]: xxxxx001b	
	8Hz	[MAG_Config]: xxxxx010b	
	10Hz	[MAG_Config]: xxxxx011b	
	15Hz	[MAG_Config]: xxxxx100b	
	20Hz	[MAG_Config]: xxxxx101b	
	25Hz	[MAG_Config]: xxxxx110b	
	30Hz	[MAG_Config]: xxxxx111b	Auto controlled in fusion mode
Operation Mode	Low Power	[MAG_Config]: xxx00xxxb	
	Regular	[MAG_Config]: xxx01xxxb	
	Enhanced Regular	[MAG_Config]: xxx10xxxb	
	High Accuracy	[MAG_Config]: xxx11xxxb	
Power Mode	Normal	[MAG_Config]: x00xxxxxb	
	Sleep	[MAG_Config]: x01xxxxxb	
	Suspend	[MAG_Config]: x10xxxxxb	
	Force Mode	[MAG_Config]: x11xxxxxb	

3.6 Output data

Depending on the selected operating mode the device will output either un-calibrated sensor data (in non-fusion mode) or calibrated / fused data (in fusion mode), this section describes the output data for each modes.

3.6.1 Unit selection

The measurement units for the various data outputs (regardless of operation mode) can be configured by writing to the UNIT_SEL register as described in Table 3-9.

Table 3-11: unit selection

Data	Units	[Reg Addr]: Register Value
Acceleration	m/s^2	[UNIT_SEL] : xxxxxxx0b
	mg	[UNIT_SEL] : xxxxxxx1b
Linear Acceleration, Gravity vector	m/s^2	[UNIT_SEL] : xxxxxxx0b
Magnetic Field Strength	Micro Tesla	NA
Angular Rate	Dps	[UNIT_SEL] : xxxxxx0xb
	Rps	[UNIT_SEL] : xxxxxx1xb
Euler Angles	Degrees	[UNIT_SEL] : xxxxx0xxb
	Radians	[UNIT_SEL] : xxxxx1xxb
Quaternion	Quaternion units	NA
Temperature	°C	[UNIT_SEL] : xxx0xxxxb
	°F	[UNIT_SEL] : xxx1xxxxb

3.6.2 Data output format

The data output format can be selected by writing to the UNIT_SEL register, this allows user to switch between the orientation definition described by Windows and Android operating systems.

Table 3-12: Fusion data output format

Parameter	Values	[Reg Addr]: Register value
Fusion data output format	Windows	[UNIT_SEL]: 0xxxxxxxb
	Android	[UNIT_SEL]: 1xxxxxxxb

The output data format is based on the following convention regarding the rotation angles for roll, pitch and heading / yaw (compare also section 3.4):

Table 3-13: Rotation angle conventions

Rotation angle	Range (Android format)	Range (Windows format)
Pitch	+180° to -180° (turning clockwise decreases values)	-180° to +180° (turning clockwise increases values)
Roll	-90° to +90° (increasing with increasing inclination)	
Heading / Yaw	0° to 360° (turning clockwise increases values)	

3.6.3 Fusion Output data rates

Table 3-14: Fusion output data rates

BNO055 Operating Mode	Data input rate			Algo calling rate	Data output rate			
	Accel	Mag	Gyro		Accel	Mag	Gyro	Fusion data
IMU	100Hz	NA	100Hz	100Hz	100Hz	NA	100Hz	100Hz
COMPASS	20Hz	20Hz	NA	20Hz	20Hz	20Hz	NA	20Hz
M4G	50Hz	50Hz	NA	50Hz	50Hz	50Hz	NA	50Hz
NDOF_FMC_OFF	100Hz	20Hz	100Hz	100Hz	100Hz	20Hz	100Hz	100Hz
NDOF	100Hz	20Hz	100Hz	100Hz	100Hz	20Hz	100Hz	100Hz

3.6.4 Sensor calibration data

The following section describes the register holding the calibration data of the sensors (see chapter 3.11). The offset and radius data can be read from these registers and stored in the host system, which could be later used to get the correct orientation data after 'Power on Reset' of the sensor.

3.6.4.1 Accelerometer offset

The accelerometer offset can be configured in the following registers, shown in the table below. There are 6 bytes required to configure the accelerometer offset (2 bytes for each of the 3 axis X, Y and Z). Configuration will take place only when the user writes the last byte (i.e., ACC_OFFSET_Z_MSB).

Table 3-15: Accelerometer Default-Reg settings

Reg Name	Default Reg Value (Bit 0 – Bit 7)
ACC_OFFSET_X_LSB	0x00
ACC_OFFSET_X_MSB	0x00
ACC_OFFSET_Y_LSB	0x00
ACC_OFFSET_Y_MSB	0x00
ACC_OFFSET_Z_LSB	0x00
ACC_OFFSET_Z_MSB	0x00

The range of the offsets for Accelerometer is +/-500 in LSB. .

Table 3-16: Accelerometer offset range settings

Offset for Sensor	Maximum Offset range in LSB
Accelerometer	+/- 500

Table 3-17: Accelerometer Unit settings

Unit	Representation
m/s^2	1 m/s^2 = 100 LSB
mg	1 mg = 1 LSB

3.6.4.2 Magnetometer offset

The magnetometer offset can be configured in the following registers,

Table 3-18: Magnetometer Default-Reg settings

Reg Name	Default Reg Value (Bit 0 – Bit 7)
MAG_OFFSET_X_LSB	0x00
MAG_OFFSET_X_MSB	0x00
MAG_OFFSET_Y_LSB	0x00
MAG_OFFSET_Y_MSB	0x00
MAG_OFFSET_Z_LSB	0x00
MAG_OFFSET_Z_MSB	0x00

There are 6 bytes required to configure the magnetometer offset (bytes (2 bytes for each of the 3 axis X, Y and Z). Configuration will take place only when the user writes the last byte (i.e., MAG_OFFSET_Z_MSB). Therefore the last byte must be written whenever the user wants to changes the configuration. The range of the magnetometer offset is +/-6400 in LSB.

Table 3-19: Magnetometer Unit settings

Unit	Representation
µT	1 µT = 16 LSB

3.6.4.3 Gyroscope offset

The gyroscope offset can be configured in the following registers, shown in the table below

Table 3-20: Gyroscope Default Reg-settings

Reg Name	Default Reg Value (Bit 0 – Bit 7)
GYR_OFFSET_X_LSB	0x00
GYR_OFFSET_X_MSB	0x00
GYR_OFFSET_Y_LSB	0x00
GYR_OFFSET_Y_MSB	0x00
GYR_OFFSET_Z_LSB	0x00
GYR_OFFSET_Z_MSB	0x00

There are 6 bytes required to configure the gyroscope offset (bytes (2 bytes for each of the 3 axis X, Y and Z). Configuration will take place only when the user writes the last byte (i.e., GYR_OFFSET_Z_MSB). Therefore the last byte must be written whenever the user wants to changes the configuration. The range of the offset for Gyroscope is +/-2000 in LSB.

Table 3-21: Gyroscope offset range settings

Offset for Sesnor	Maximum Offset range in LSB
Gyroscope	+/- 2000

Table 3-22: Gyroscope unit settings

Unit	Representation
Dps	1 Dps = 16 LSB
Rps	1 Rps = 900 LSB

3.6.4.4 Radius

The radius of accelerometer and magnetometer can be configured in the following registers,

Table 3-23: Radius Default-Reg settings

Reg Name	Default Reg Value (Bit 0 – Bit 7)
ACC_RADIUS_LSB	0x00
ACC_RADIUS_MSB	0x00
MAG_RADIUS_LSB	0x00
MAG_RADIUS_MSB	0x00

There are 4 bytes (2 bytes for each accelerometer and magnetometer) to configure the radius. Configuration will take place only when user writes to the last byte (i.e., ACC_RADIUS_MSB and MAG_RADIUS_MSB). Therefore the last byte must be written whenever the user wants to changes the configuration. The range of the radius for accelerometer is +/-2048 in LSB, magnetometer is from 144 to 1280 in LSB and Gyroscope is NA.

Table 3-24: Radius range settings

Radius for sensor	Maximum Range in LSB
Accelerometer	+/- 2048
Magnetometer	144 to 1280

3.6.5 Output data registers

3.6.5.1 Acceleration data

In non-fusion mode uncompensated acceleration data for each axis X/Y/Z, can be read from the appropriate ACC_DATA_<axis>_LSB and ACC_DATA_<axis>_MSB registers.

In fusion mode the fusion algorithm output offset compensated acceleration data for each axis X/Y/Z, the output data can be read from the appropriate ACC_DATA_<axis>_LSB and ACC_DATA_<axis>_MSB registers. Refer table below for information regarding the data types for the acceleration data.

Table 3-25: Acceleration data

Parameter	Data type	bytes
Accel_Data_X	signed	2
Accel_Data_Y	signed	2

Parameter	Data type	bytes
Accel_Data_Z	signed	2

3.6.5.2 Magnetic Field Strength

In non-fusion mode uncompensated field strength data for each axis X/Y/Z, can be read from the appropriate MAG_DATA_<axis>_LSB and MAG_DATA_<axis>_MSB registers.

In fusion mode the fusion algorithm output offset compensated magnetic field strength data for each axis X/Y/Z, the output data can be read from the appropriate MAG_DATA_<axis>_LSB and MAG_DATA_<axis>_MSB registers. Refer table below for information regarding the data types for the magnetic field strength.

Table 3-26: Magnetic field strength data

Parameter	Data type	bytes
Mag_Data_X	signed	2
Mag_Data_Y	signed	2
Mag_Data_Z	signed	2

3.6.5.3 Angular Velocity

In non-fusion mode uncompensated angular velocity (yaw rate) data for each axis X/Y/Z, can be read from the appropriate GYR_DATA_<axis>_LSB and GYR_DATA_<axis>_MSB registers.

In fusion mode the fusion algorithm output offset compensated angular velocity (yaw rate) data for each axis X/Y/Z, the output data can be read from the appropriate GYR_DATA_<axis>_LSB and GYR_DATA_<axis>_MSB registers. Refer table below for information regarding the data types for the angular velocity.

Table 3-27: Yaw rate data

Parameter	Data type	bytes
Gyr_Data_X	signed	2
Gyr_Data_Y	signed	2
Gyr_Data_Z	signed	2

3.6.5.4 Orientation (Euler angles)

Orientation output only available in fusion operation modes.

The fusion algorithm output offset and tilt compensated orientation data in Euler angles format for each DOF Heading/Roll/Pitch, the output data can be read from the appropriate EUL<dof>_LSB and EUL_<dof>_MSB registers. Refer table below for information regarding the data types and the unit representation for the Euler angle format.

Table 3-28: Compensated orientation data in Euler angles format

Parameter	Data type	bytes
EUL_Heading	Signed	2
EUL_Roll	Signed	2
EUL_Pitch	Signed	2

Table 3-29: Euler angle data representation

Unit	Representation
Degrees	1 degree = 16 LSB
Radians	1 radian = 900 LSB

3.6.5.5 Orientation (Quaternion)

Orientation output only available in fusion operating modes.

The fusion algorithm output offset and tilt compensated orientation data in quaternion format for each DOF w/x/y/z, the output data can be read from the appropriate QUA_DATA_<dof>_LSB and QUA_DATA_<dof>_MSB registers. Refer table below for information regarding the data types and the unit representation for the Orientation output.

Table 3-30: Compensated orientation data in quaternion format

Parameter	Data type	bytes
QUA_Data_w	Signed	2
QUA_Data_x	Signed	2
QUA_Data_y	Signed	2
QUA_Data_z	Signed	2

Table 3-31: Quaternion data representation

Unit	Representation
Quaternion (unit less)	1 Quaternion (unit less) = 2^{14} LSB

3.6.5.6 Linear Acceleration

Linear acceleration output only available in fusion operating modes.

The fusion algorithm output linear acceleration data for each axis x/y/z, the output data can be read from the appropriate LIA_DATA_<axis>_LSB and LIA_DATA_<axis>_MSB registers. Refer to the table below for further information regarding the data types and the unit representation for Linear acceleration.

Note: The linear acceleration signal typically cannot be integrated to recover velocity, or double-integrated to recover position. The error typically becomes larger than the signal within less than 1 second if other sensor sources are not used to compensate this integration error.

Table 3-32: Linear Acceleration Data

Parameter	Data type	bytes
LIA_Data_X	signed	2
LIA_Data_Y	signed	2
LIA_Data_Z	signed	2

Table 3-33: Linear Acceleration data representation

Unit	Representation
m/s^2	$1\ m/s^2$ = 100 LSB
mg	1 mg = 1 LSB

3.6.5.7 Gravity Vector

Gravity Vector output only available in fusion operating modes.

The fusion algorithm output gravity vector data for each axis x/y/z, the output data can be read from the appropriate GRV_DATA_<axis>_LSB and GRV_DATA_<axis>_MSB registers. Refer table below for further information regarding the data types and the unit representation for the Gravity vector.

Table 3-34: Gravity Vector Data

Parameter	Data type	bytes
GRV_Data_X	signed	2
GRV_Data_Y	signed	2
GRV_Data_Z	signed	2

Table 3-35: Gravity Vector data representation

Unit	Representation
m/s^2	$1\ m/s^2$ = 100 LSB
mg	1 mg = 1 LSB

Temperature

The temperature output data can be read from the TEMP register. The table below describes the output data type and data representation (depending on selected unit).
The temperature can be read from one of two sources, the temperature source can be selected by writing to the TEMP_SOURCE register as detailed below.

Table 3-36: Temperature Data

Parameter	Data type	bytes
TEMP	signed	1

Table 3-37: Temperature data representation

Unit	Representation
°C	1°C = 1 LSB
F	2 F = 1 LSB

Table 3-38: Temperature Source Selection

Source	[Reg Addr]: Register Value
Accelerometer	[TEMP_SOURCE]: xxxxxx00b
Gyroscope	[TEMP_SOURCE]: xxxxxx01b

3.7 Data register shadowing

This section describes the two methods to read sensor data from the BNO055 register map. In the first method also called multi byte read (or burst read) the data consistency is ensured by data register shadowing and hence the LSB and MSB of each axis are all referring to the same instance (refer section 4.6 I2C read access)
Whereas in the single byte reads, the MSB may get updated when the data in LSB is read and thereby resulting in data inconsistency.
So depending upon the application, the user may select the type of data read to ensure that the correct data is being read.

3.8 Interrupts

3.8.1 Interrupt Pin

INT is configured as interrupt pin for signaling an interrupt to the host. The interrupt trigger is configured as raising edge and is latched on to the INT pin. Once an interrupt occurs, the INT pin is set to high and will remain high until it is reset by host. This can be done by setting RST_INT in SYS_TRIGGER register.

Interrupts can be enabled by setting the corresponding bit in the interrupt enable register (INT_EN) and disabled when it is cleared.

Interrupt Pin Masking

Interrupts can be routed to the INT pin by setting the corresponding interrupt bit in the INT_MSK register.

Interrupt Status

Interrupt occurrences are stored in the interrupt status register (INT_STA). All bits in this register are cleared on read.

3.8.2 Interrupt Settings

3.8.2.1 Data Ready Interrupt (DRDY INT)

Note: Data ready interrupt is only available on software versions 03.14 and above

Data Ready Interrupt is a signal to host about the data availability in the register map, so that host can read the sensor data immediately when the sensor data is available in the register map.

The following data ready interrupts are available,

1. Accelerometer or fusion data ready interrupt (ACC_BSX_DRDY)
2. Magnetometer data ready interrupt (MAG_DRDY)
3. Gyroscope data ready interrupt (GYR_DRDY)

In Non-fusion mode:

- In Non-fusion mode the data ready interrupt is signaled based on individual sensor data rate configured to the sensors.

- The data ready interrupt "ACC_BSX_DRDY" is set/triggered when the Accelerometer data is available in the register map at the configured data rate of sensor in the operation mode where Accelerometer is ON.

- The data ready interrupt "MAG_DRDY" is set/triggered when the Magnetometer data is available in the register map at the configured data rate of sensor in the operation mode where Magnetometer is ON.

- The data ready interrupt "GYR_DRDY" is set/triggered when the Gyroscope data is available in the register map at the configured data rate of sensor in the operation mode where Gyroscope is ON.

In fusion mode:
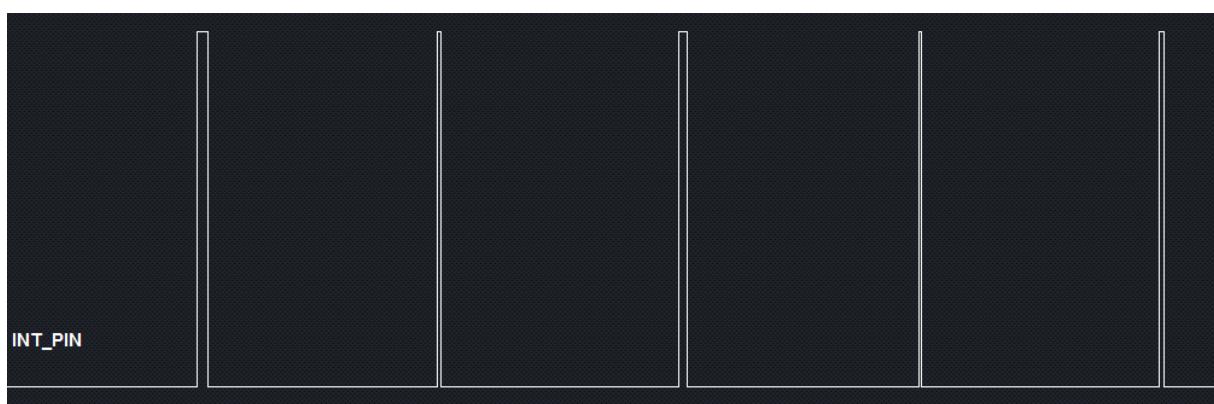

- In fusion mode the data ready interrupt is signaled based on primary sensor data rate.
- The data ready interrupt "ACC_BSX_DRDY" is set/triggered when the calibrated/fusion data available in the register map at the primary rate of the sensor.

Here, the data ready interrupt "ACC_BSX_DRDY" is shared between non-fusion and fusion mode for Accelerometer and fusion data respectively.
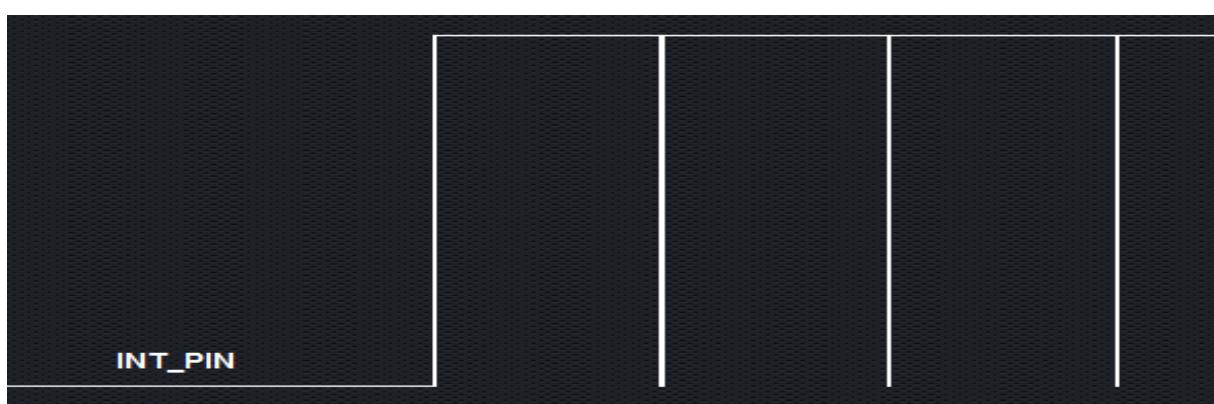

Data Ready Interrupt Behavior:

Once an interrupt occurs, the INT pin is set to high and will remain high until it is reset or read by host. The INT is set to low and high immediately when multiple interrupt occurs before host reset or read.

Data Ready Interrupt behavior when host reads the interrupt status:

Data Ready Interrupt behavior when the interrupt status is not read:

3.8.2.2 Accelerometer Slow/No Motion Interrupt

The slow-motion/no-motion interrupt engine can be configured in two modes.

Slow-motion Interrupt is triggered when the measured slope of at least one enabled axis exceeds the programmable slope threshold for a programmable number of samples. Hence the engine behaves similar to the any-motion interrupt, but with a different set of parameters. In order to suppress false triggers, the interrupt is only generated (cleared) if a certain number N of consecutive slope data points is larger (smaller) than the slope threshold given by *slo_no_mot_dur<1:0>*. The number is *N = slo_no_mot_dur<1:0> + 1*.

In no-motion mode an interrupt is generated if the slope on all selected axes remains smaller than a programmable threshold for a programmable delay time. Figure 11 shows the timing diagram for the no-motion interrupt. The scaling of the threshold value is identical to that of the slow-motion interrupt. However, in no-motion mode register slo_no_mot_dur defines the delay time before the no-motion interrupt is triggered.

Table 3-39 lists the delay times adjustable with register slo_no_mot_dur. The timer tick period is 1 second. Hence using short delay times can result in considerable timing uncertainty.

If bit *SM/NM* is set to '1' ('0'), the no-motion/slow-motion interrupt engine is configured in the no-motion (slow-motion) mode. Common to both modes, the engine monitors the slopes of the axes that have been enabled with bits *AM/NM_X_AXIS*, *AM/NM_Y_AXIS*, and *AM/NM_Z_AXIS* for the x-axis, y-axis and z-axis, respectively. The measured slope values are continuously compared against the threshold value defined in register ACC_NM_THRES. The scaling is such that 1 LSB of ACC_NM_THRES corresponds to 3.91 mg in 2g-range (7.81 mg in 4g-range, 15.6 mg in 8g-range and 31.3 mg in 16g-range). Therefore the maximum value is 996 mg in 2g-range (1.99g in 4g-range, 3.98g in 8g-range and 7.97g in 16g-range). The time difference between the successive acceleration samples depends on the selected bandwidth and equates to $1/(2 * bw)$.

Table 3-39: No-motion time-out periods

slo_no_mot_dur	Delay time	slo_no_mot_dur	Delay time	slo_no_mot_dur	Delay Time
0	1 s	16	40 s	32	88 s
1	2 s	17	48 s	33	96 s
2	3 s	18	56 s	34	104 s
...	...	19	64 s.	...	...
14	15 s	20	72 s	62	328 s
15	16 s	21	80 s	63	336 s

Note: slo_no_mot_dur values 22 to 31 are not specified
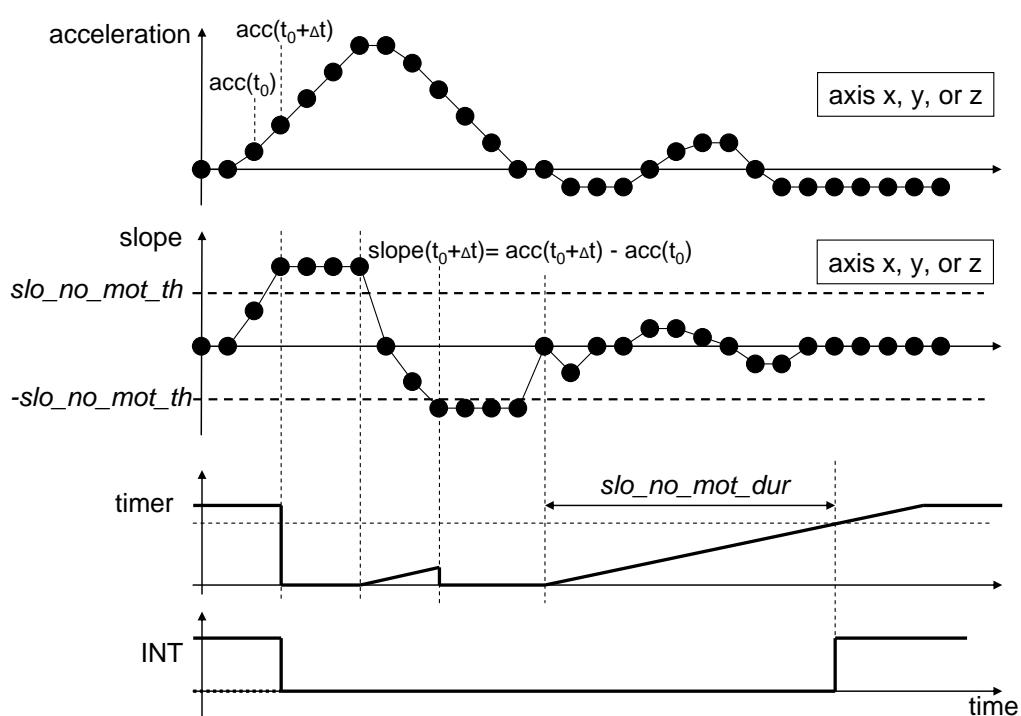

Table 3-40: Timing of No-motion interrupt

Params	Value	[Reg Addr]: Register Value
Detection Type	No Motion	[ACC_NM_SET]: xxxxxxx1b
	Slow Motion	[ACC_NM_SET]: xxxxxxx0b
Interrupt Parameters	Threshold	[ACC_NM_THRE]: bit7:bit0
	Duration	[ACC_NM_SET]: bit6:bit1
Axis selection	X-axis	[ACC_INT_Settings]: xxxxx1xxb
	Y-axis	[ACC_INT_Settings]: xxxx1xxxb
	Z-axis	[ACC_INT_Settings]: xxx1xxxxb

3.8.2.3 Accelerometer Any Motion Interrupt

The any-motion interrupt uses the slope between successive acceleration signals to detect changes in motion. An interrupt is generated when the slope (absolute value of acceleration difference) exceeds a preset threshold. It is cleared as soon as the slope falls below the threshold. The principle is made clear in Figure 2: Principle of any-motion detection.
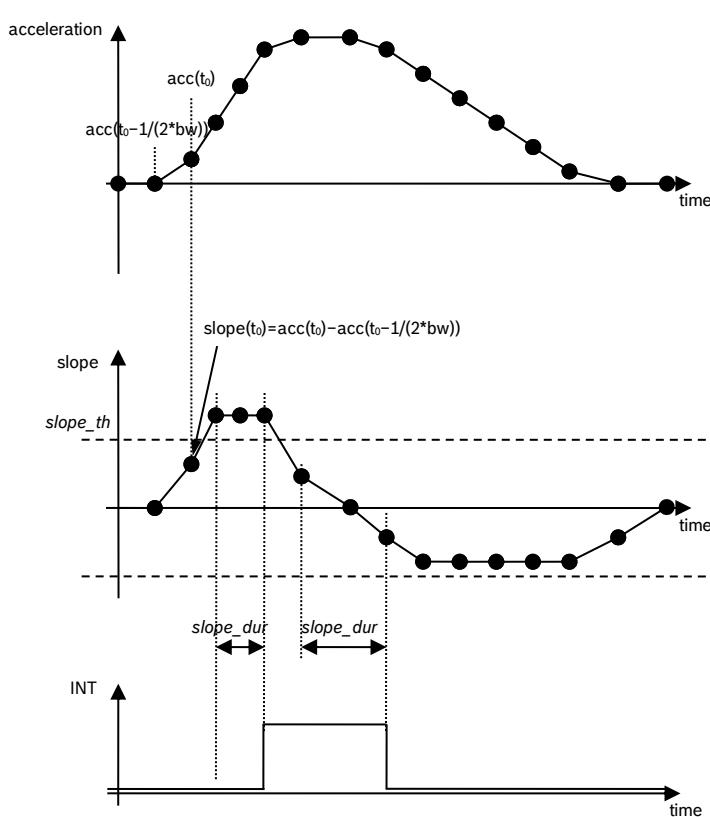

Figure 2: Principle of any-motion detection

The threshold is defined through register ACC_AM_THRES. In terms of scaling 1 LSB of ACC_AM_THRES corresponds to 3.91 mg in 2g-range (7.81 mg in 4g-range, 15.6 mg in 8g-range and 31.3 mg in 16g-range). Therefore the maximum value is 996 mg in 2g-range (1.99g in 4g-range, 3.98g in 8g-range and 7.97g in 16g-range).

The time difference between the successive acceleration signals depends on the selected bandwidth and equates to $1/(2*bandwidth)$ $(\Delta t=1/(2*bw))$. In order to suppress false triggers, the interrupt is only generated (cleared) if a certain number N of consecutive slope data points is larger (smaller) than the slope threshold given by ACC_AM_THRES. This number is set by the AM_DUR bits. It is $N = AM\_DUR + 1$.

Example: *AM_DUR* = 00b, …, 11b = 1decimal, …, 4decimal.

Enabling (disabling) for each axis:

Any-motion detection can be enabled (disabled) for each axis separately by writing ´1´ (´0´) to bits AM/NM_X_AXIS, AM/NM_Y_AXIS, AM/NM_Z_AXIS. The criteria for any-motion detection are fulfilled and the slope interrupt is generated if the slope of any of the enabled axes exceeds the threshold ACC_AM_THRES for [AM_DUR +1] consecutive times. As soon as the slopes of all enabled axes fall or stay below this threshold for [AM_DUR +1] consecutive times the interrupt is cleared unless interrupt signal is latched.

Table 3-41: Any-motion Interrupt parameters and Axis selection

Params	Value	[Reg Addr]: Register Value
Interrupt Parameters	Threshold	[ACC_AM_THRES]: bit7:bit0
	Duration	[ACC_INT_Settings]: bit1:bit0
Axis selection	X-axis	[ACC_INT_Settings]: xxxxx1xxb
	Y-axis	[ACC_INT_Settings]: xxxx1xxxb
	Z-axis	[ACC_INT_Settings]: xxx1xxxxb

3.8.2.4 Accelerometer High G Interrupt

This interrupt is based on the comparison of acceleration data against a high-g threshold for the detection of shock or other high-acceleration events.

The high-g interrupt is enabled (disabled) per axis by writing ´1´ (´0´) to bits ACC_HIGH_G in the INT_EN register and enabling the axis in with bits HG_X_AXIS, HG_Y_AXIS, and HG_Z_AXIS, respectively in the ACC_INT_Settings register. The high-g threshold is set through the ACC_HG_THRES register. The meaning of an LSB of ACC_HG_THRES depends on the selected g-range: it corresponds to 7.81 mg in 2g-range, 15.63 mg in 4g-range, 31.25 mg in 8g-range, and 62.5 mg in 16g-range (i.e. increment depends from g-range setting).

The high-g interrupt is generated if the absolute value of the acceleration of at least one of the enabled axes (´or´ relation) is higher than the threshold for at least the time defined by the ACC_HG_DURATION register. The interrupt is reset if the absolute value of the acceleration of all enabled axes (´and´ relation) is lower than the threshold for at least the time defined by the ACC_HG_DURATION register. The interrupt status is stored in bit ACC_HIGH_G in the INT_STA register. The relation between the content of ACC_HG_DURATION and the actual delay of the interrupt generation is delay [ms] = [ACC_HG_DURATION + 1] * 2 ms. Therefore, possible delay times range from 2 ms to 512 ms.

Table 3-42: High-G Interrupt parameters and Axis selection

Params	Value	[Reg Addr]: Register Value
Interrupt Parameters	Threshold	[ACC_HG_THRES]: bit7 : bit0
	Duration	[ACC_HG_DURATION]: bit7 : bit0

	Y-axis	[ACC_INT_Settings]: x1xxxxxxb
	Z-axis	[ACC_INT_Settings]: 1xxxxxxxb

3.8.2.5 Gyroscope High Rate Interrupt

This interrupt is based on the comparison of angular rate data against a high-rate threshold for the detection of shock or other high-angular rate events. The principle is made clear in Figure 3 below:
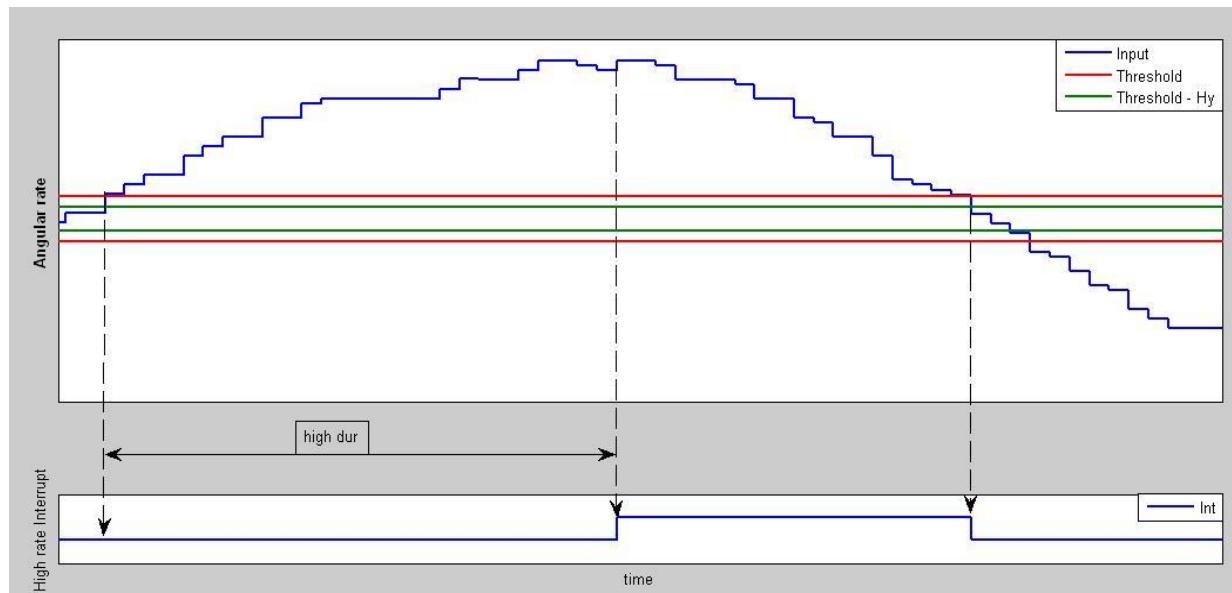

Figure 3: High rate interrupt

The high-rate interrupt is enabled (disabled) per axis by writing ´1´ (´0´) to bits *GYRO_HIGH_RATE* in the *INT_EN* register and for each axis by writing to the *HR_X_AXIS*, *HR_Y_AXIS*, and *HR_Z_AXIS*, respectively in the GYR_INT_SETTING register. The high-rate threshold is set through the *HR_<axis>_* Threshold bits in the appropriate *GYR_HR_<axis>_SET register*. The meaning of an LSB of *HR_<axis>_Threshold* depends on the selected °/s-range: it corresponds to 62.5°/s in 2000°/s-range, 31.25°/s in 1000°/s-range, 15.625°/s in 500°/s -range ...). The *HR_<axis>_Threshold* register setting 0 corresponds to 62.26°/s in 2000°/s-range, 31.13°/s in 1000°/s-range, 15.56°/s in 500°/s-range .... Therefore the maximum value is 1999.76°/s in 2000°/s-range (999.87°/s 1000°/s-range, 499.93°/s in 500°/s -range ...).

A hysteresis can be selected by setting the *HR_<axis>_THRES_HYST* bits. Analogously to threshold, the meaning of an LSB of *HR_<axis>_THRES_HYST* bits is °/s-range dependent: The *HR_<axis>_THRES_HYST* register setting 0 corresponds to an angular rate difference of 62.26°/s in 2000°/s-range, 31.13°/s in 1000°/s-range, 15.56°/s in 500°/s-range .... The meaning of an LSB of *HR_<axis>_THRES_HYST* depends on the selected °/s-range too: it corresponds to 62.5°/s in 2000°/s-range, 31.25°/s in 1000°/s-range, 15.625°/s in 500°/s -range ...).

The high-rate interrupt is generated if the absolute value of the angular rate of at least one of the enabled axes (´or´ relation) is higher than the threshold for at least the time defined by the *GYR_DUR_<axis>* register. The interrupt is reset if the absolute value of the angular rate of all enabled axes (´and´ relation) is lower than the threshold minus the hysteresis. In bit *GYR_HIGH_RATE* in the *INT_STA* the interrupt status is stored. The relation between the content of *GYR_DUR_<axis>* and the actual delay of the interrupt generation is delay [ms] = [*GYR_DUR_<axis>* + 1] * 2.5 ms. Therefore, possible delay times range from 2.5 ms to 640 ms.

Table 3-43: High Rate Interrupt parameters and Axis selection

	Hysteresis	[GYR_HR_Z_SET]: bit6 : bit5

3.8.2.6 Gyroscope Any Motion Interrupt

Any-motion (slope) detection uses the slope between successive angular rate signals to detect changes in motion. An interrupt is generated when the slope (absolute value of angular rate difference) exceeds a preset threshold. It is cleared as soon as the slope falls below the threshold. The principle is made clear in Figure 4.
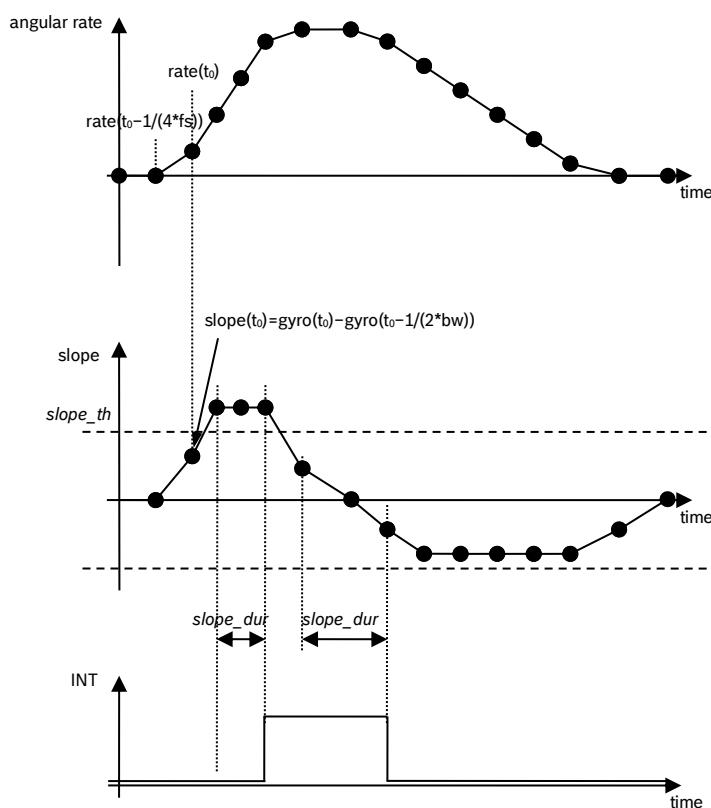

Figure 4: Principle of any-motion detection

The threshold is defined through register GYR_AM_THRES. In terms of scaling 1 LSB of GYR_AM_THRES corresponds to 1 °/s in 2000°/s-range (0.5°/s in 1000°/s-range, 0.25°/s in 500°/s -range ...). Therefore the maximum value is 125°/s in 2000°/s-range (62.5°/s 1000°/s-range, 31.25 in 500°/s -range ...).

The time difference between the successive angular rate signals depends on the selected update rate(fs) which is coupled to the bandwidth and equates to $1/(4*fs)$ $(t=1/(4*fs))$. For bandwidth settings with an update rate higher than 400Hz (bandwidth =0,1,2) fs is set to 400Hz.

In order to suppress false triggers, the interrupt is only generated (cleared) if a certain number N of consecutive slope data points is larger (smaller) than the slope threshold given by GYR_AM_THRES. This number is set by the Slope Samples bits in the GYR_AM_SET register. It is N = [Slope Samples + 1]*4. N is set in samples. Thus the time is scaling with the update rate (fs).

3.8.2.7 Enabling (disabling) for each axis

Any-motion detection can be enabled (disabled) for each axis separately by writing ´1´ (´0´) to bits *AM_X_AXIS, AM_Y_AXIS, AM_Z_AXIS in the GYR_INT_SETTING register*. The criteria for any-motion detection are fulfilled and the Any-Motion interrupt is generated if the slope of any of the enabled axes exceeds the threshold GYR_AM_THRES for [Slope Samples+1]*4 consecutive times. As soon as the slopes of all enabled axes fall or stay below this threshold for [Slope Samples +1]*4 consecutive times the interrupt is cleared unless interrupt signal is latched.

3.8.2.8 Axis of slope / any motion interrupt

The interrupt status is stored in bit *GYRO_AM* in the *INT_EN* register. The Any-motion interrupt supplies additional information about the detected slope.

Table 3-44: Axis selection and any motion interrupt

Params	Value	[Reg Addr]: Register Value
Axis selection	X-axis	[GYR_INT_SETING]: xxxxxxx1b
	Y-axis	[GYR_INT_SETING]: xxxxxx1xb
	Z-axis	[GYR_INT_SETING]: xxxxx1xxb

	Unfiltered	[GYR_INT_SETING]: x1xxxxxxb
Interrupt Settings	Threshold	[GYR_AM_THRES]: bit6 : bit0
	Slope Samples	[GYR_AM_SET]: bit1 : bit0
	Awake Duration	[GYR_AM_SET]: bit3 : bit2

3.9 Self-Test

3.9.1 Power On Self Test (POST)

During the device startup, a power on self test is executed. This feature checks that the connected sensors and microcontroller are responding / functioning correctly. Following tests are executed

Table 3-45: Power on Self Test

Components	Test type
Accelerometer	Verify chip ID
Magnetometer	Verify chip ID
Gyroscope	Verify chip ID
Microcontroller	Memory Build In Self Test

The results of the POST are stored at register ST_RESULT, where a bit set indicates test passed and cleared indicates self test failed.

3.9.2 Built-In Self-Test (BIST)

The host can trigger a self-test from CONFIG MODE. The test can be triggered by setting bit SELF_TEST in the in the SYS_TRIGGER register, the results are stored in the ST_RESULT register. During the execution of the system test, all other features are paused.

It is recommended to only trigger the self-test config mode.

During the self-test:

- When triggering the BIST, the SYS_STATUS changes to "executing selftest", but the SYS_STATUS will be updated **only in case of failure**, not in case of success.
- To know if the BIST succeeded/failed you should:
  - o Trigger BIST
  - o Wait for 400ms
  - o Read SYS_ERROR register (0x3A):
    - ▪ SYS_ERROR will remain at 0 in case of success (0 = No error)
    - ▪ SYS_ERROR will show 3 in case of self-test failure (3 = Self-test result failed)
  - o In case of failed BIST (SYS_ERROR != 0 above), you can see which sensor failed by reading the ST_RESULT (0x36) register (bit of the corresponding sensor is '1' if self-test was successful, but will show '0' if the self-test failed).

Table 3-46: Built-in self-test

Components	Test type
Accelerometer	built in self-test
Magnetometer	built in self-test
Gyroscope	built in self-test
Microcontroller	No test performed

3.10 Boot loader

The boot loader is located at the start of the program memory and it is executed at each reset / power-on sequence. It first checks the status of the nBOOT_LOAD_PIN.

If the nBOOT_LOAD_PIN is pulled low during reset / power-on sequence, it continues execution in boot loader mode. Otherwise the device continues to boot in application mode.

In case there is a firmware update, then an application note would be available in time with the necessary information to upgrade at the host side. Nevertheless it is recommended that the nBOOT_LOAD_PIN is connected as shown in section 5.

3.11 Calibration

Though the sensor fusion software runs the calibration algorithm of all the three sensors (accelerometer, gyroscope and magnetometer) in the background to remove the offsets, some preliminary steps had to be ensured for this automatic calibration[5] to take place.
The accelerometer and the gyroscope are relatively less susceptible to external disturbances, as a result of which the offset is negligible. Whereas the magnetometer is susceptible to external magnetic field and therefore to ensure proper heading accuracy, the calibration steps described below have to be taken.
Depending on the sensors been selected in the fusion mode, the following simple steps had to be taken after every 'Power on Reset' for proper calibration of the device.

3.11.1 Accelerometer Calibration

- Place the device in 6 different stable positions for a period of few seconds to allow the accelerometer to calibrate.
- Make sure that there is slow movement between 2 stable positions
- The 6 stable positions could be in any direction, but make sure that the device is lying at least once perpendicular to the x, y and z axis.
- The register CALIB_STAT can be read to see the calibration status of the accelerometer.

3.11.2 Gyroscope Calibration

- Place the device in a single stable position for a period of few seconds to allow the gyroscope to calibrate
- The register CALIB_STAT can be read to see the calibration status of the gyroscope.

3.11.3 Magnetometer Calibration

Magnetometer in general are susceptible to both hard-iron and soft-iron distortions, but majority of the cases are rather due to the former. And the steps mentioned below are to calibrate the magnetometer for hard-iron distortions.
Nevertheless certain precautions need to be taken into account during the positioning of the sensor in the PCB which is described in our HSMI (Handling, Soldering and Mounting Instructions) application note to avoid unnecessary magnetic influences.

---

[5] It is not possible to disable the automatic calibration which runs in the background

Compass, M4G & NDOF_FMC_OFF:
- Make some random movements (for example: writing the number '8' on air) until the CALIB_STAT register indicates fully calibrated.
- It takes more calibration movements to get the magnetometer calibrated than in the NDOF mode.

NDOF:
- The same random movements have to be made to calibrate the sensor as in the FMC_OFF mode, but here it takes relatively less calibration movements (and slightly higher current consumption) to get the magnetometer calibrated.
- The register CALIB_STAT can be read to see the calibration status of the magnetometer.

3.11.4 Soft-Iron Calibration (SIC)

The BNO055 supports SIC via a 3x3 calibration matrix. At startup, the identity matrix is used as coefficients to the magnetometer signal. An SIC compensation matrix can efficiently compensate for distortions due to soft magnetic material in close vicinity of the sensor. The magnetometer data is first multiplied by this SIC matrix, before being used in the sensor fusion algorithm.

Table 3-47: Soft-Iron Calibration matrix definition

$$\begin{bmatrix} Msb0Lsb0 & Msb1Lsb1 & Msb2Lsb2 \\ Msb3Lsb3 & Msb4Lsb4 & Msb5Lsb5 \\ Msb6Lsb6 & Msb7Lsb7 & Msb8Lsb8 \end{bmatrix}$$

Each value of the matrix is represented by a 16-bit signed integer, and can represents a value in the range of -2.0000 to 1.9999 by using the conversion factor $(1/2^{14})$.

Table 3-48: Soft-Iron Calibration matrix scaling factor

User Value	Conversion Factor	Actual Value
-32768	$1/2^{14}$	-2.0000
...		...
-16384	$1/2^{14}$	-1.0000
...		...
0	$1/2^{14}$	0.0000
...		...
16384	$1/2^{14}$	1.0000
...		...
32767	$1/2^{14}$	1.9999

3.11.4.1 SIC matrix generation

The preferred method for generating the soft-iron calibration matrix is to use Helmholtz coils, although a less precise field calibration using the earth's magnetic field is also possible. The generation of the SIC matrix is the sole responsibility of the customer.

3.11.5 Reuse of Calibration Profile

Once the device is calibrated, the calibration profile can be reused to get the correct orientation data immediately after 'Power of Reset' (prior to going through the steps mentioned in the above section). However, once the sensor enters the internal calibration routine, the calibration profile is overwritten with the newly obtained sensor offsets and sensor radius. Depending on the application, necessary steps had to be ensured for proper calibration of the sensor.

Reading Calibration profile
The calibration profile includes sensor offsets and sensor radius. Host system can read the offsets and radius only after a full calibration is achieved and the operation mode is switched to CONFIG_MODE. Refer to sensor offsets and sensor radius registers.

Setting Calibration profile
It is important that the correct offsets and corresponding sensor radius are used. Incorrect offsets may result in unreliable orientation data even at calibration accuracy level 3. To set the calibration profile the following steps need to be taken
1. Select the operation mode to CONFIG_MODE
2. Write the corresponding sensor offsets and radius data
3. Change operation mode to fusion mode

4. **Register description**

4.1 General Remarks

The entire communication with the device is performed by reading from and writing to registers. Registers have a width of 8 bits. There are several registers which are either completely or partially marked as 'reserved'. Any reserved bit is ignored when it is written and no specific value is guaranteed when read. It is recommended not to use registers at all which are completely marked as 'reserved'. Furthermore it is recommended to mask out (logical and with zero) reserved bits of registers which are partially marked as reserved.

Read-Only Registers are marked as shown in Table 4-1: Register Access Coding. Any attempt to write to these registers is ignored.
There are bits within some registers that trigger internal sequences. These bits are configured for write-only access and read as value ´0´.

4.2 Register map

The register map is separated into two logical pages, Page 1 contains sensor specific configuration data and Page 0 contains all other configuration parameters and output data.

At power-on Page 0 is selected, the PAGE_ID register can be used to identify the current selected page and change between page 0 and page 1.

DATA	bits	Description
SLP_DURATION <3:0>	<4:1>	Write: The sleep duration for accelerometer low power mode can be only configured in the sensor operation mode where no fusion library is running. Following sleep phase duration is possible to set.

SLP_DURATION	Accelerometer Sleep Phase Duration
0000b	0.5 ms
0001b	0.5 ms
0010b	0.5 ms
0011b	0.5 ms
0100b	0.5 ms
0101b	0.5 ms
0110b	1 ms
0111b	2 ms
1000b	4 ms
1001b	6 ms
1010b	10 ms
1011b	25 ms
1100b	50 ms
1101b	100 ms
1110b	500 ms
1111b	1000 ms

DATA	bits	Description
SLP_MODE	0	The sleep timer mode for accelerometer low power mode can be only configured in the sensor operation mode where no fusion library is running Write 0: use event driven time-base mode 1: use equidistant sampling time-base mode

4.4.7 GYR_Sleep_Config 0x0D

	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
Access	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w
Reset	0	0	0	0	0	0	0	0
Content	reserved		AUTO_SLP_DURATION <2:0>			SLP_DURATION <2:0>		

DATA	bits	Description
AUTO_SLP_DURATION <2:0>	<5:3>	The Gyroscope can be configures in the advanced power mode to optimize the power consumption. This can be only done if the selected operation mode in sensor mode. The auto sleep duration is the wake up duration of gyroscope during the duty cycling between normal and fast-power up mode. Possible configuration for auto sleep duration are: <table><tr><td>Auto sleep duration</td><td>Time (ms)</td></tr><tr><td>000b</td><td>Not allowed</td></tr><tr><td>001b</td><td>4 ms</td></tr><tr><td>010b</td><td>5 ms</td></tr><tr><td>011b</td><td>8 ms</td></tr><tr><td>100b</td><td>10 ms</td></tr><tr><td>101b</td><td>15 ms</td></tr><tr><td>110b</td><td>20 ms</td></tr><tr><td>111b</td><td>40 ms</td></tr></table>
SLP_DURATION <2:0>	<2:0>	The Gyroscope can be configures in the advanced power mode to optimize the power consumption. This can be only done if the selected operation mode in sensor mode. The sleep duration is the sleep time of gyroscope during the duty cycling between normal and fast-power up mode. Possible configuration for sleep duration are: <table><tr><td>Sleep duration</td><td>Time (ms)</td></tr><tr><td>000b</td><td>2 ms</td></tr><tr><td>001b</td><td>4 ms</td></tr><tr><td>010b</td><td>5 ms</td></tr><tr><td>011b</td><td>8 ms</td></tr><tr><td>100b</td><td>10 ms</td></tr><tr><td>101b</td><td>15 ms</td></tr><tr><td>110b</td><td>18 ms</td></tr><tr><td>111b</td><td>20 ms</td></tr></table>

The only restriction for the use of the power save mode comes from the configuration of the digital filter bandwidth of gyroscope. For each bandwidth configuration, minimum auto sleep duration must be ensured. For example, for bandwidth = 47Hz, the minimum auto sleep duration is 5ms. This is specified in the table below. For sleep duration, there is no restriction.

Gyroscope bandwidth (Hz)	Mini Autosleep duration (ms)
32 Hz	20 ms
64 Hz	10 ms
12 Hz	20 ms
23 Hz	10 ms
47 Hz	5 ms
116 Hz	4 ms
230 Hz	4 ms
Unfiltered (523 Hz)	4 ms

Content	reserved	slo_no_mot_dur <5:0>						SMNM

DATA	bits	Description
slo_no_mot_dur <5:0>	<6:1>	Function depends on whether the slow-motion or no-motion interrupt function has been selected. If the slow-motion interrupt function has been enabled (SMNM = '0') then [slo_no_mot_dur<1:0>+1] consecutive slope data points must be above the slow/no-motion threshold (ACC_NM_THRES) for the slow-/no-motion interrupt to trigger. If the no-motion interrupt function has been enabled (SMNM = '1') then slo_no_motion_dur<5:0> defines the time for which no slope data points must exceed the slow/no-motion threshold (ACC_NM_THRES) for the slow/no-motion interrupt to trigger. The delay time in seconds may be calculated according with the following equation: slo_no_mot_dur<5:4>='b00' → [slo_no_mot_dur<3:0> + 1] slo_no_mot_dur<5:4>='b01' → [slo_no_mot_dur<3:0> * 4 + 20] slo_no_mot_dur<5>='1' → [slo_no_mot_dur<4:0> * 8 + 88]
SMNM	0	Select slow motion or no motion interrupt 0: Slow motion; 1: No motion

4.5 Digital Interface

The BNO055 supports two digital interfaces for communication between the salve and host device: I²C which supports the HID-I2C protocol and I2C Standard and Fast modes; and the UART interface.

The active interface is selected by the state of the protocol select pins (PS1 and PS0), Table 4-4 shows the mapping between the protocol select pins and the selected interface mode.

Table 4-4: protocol select pin mapping

PS1	PS0	Functionality
0	0	Standard/Fast I2C Interface
0	1	HID over I2C
1	0	UART Interface
1	1	Reserved

It is not allowed to keep the protocol select pins floating.

Both digital interfaces share partially the same pins, the pin mapping for each interface is shown in Table 4-5.

Table 4-5: Mapping of digital interface pins

PIN	I2C Interfaces (PS1=0b0)	UART Interface (PS1.PS0=0b10)
COM0	SDA	Tx
COM1	SCL	Rx
COM2	GNDIO	
COM3	I2C address select	

The following table shows the electrical specifications of the interface pins:

Table 4-6: Electrical specification of the interface pins

Parameter	Symbol	Condition	Min	Typ	Max	Units
Pull-up Resistance, COM3 pin	R_{up}	Internal Pull-up Resistance to VDDIO	20	40	60	kΩ
Input Capacitance	C_{in}			5	10	pF
I²C Bus Load Capacitance (max. drive capability)	C_{I2C_Load}				400	pF

4.6 I2C Protocol

The I²C bus uses SCL (= SCx pin, serial clock) and SDA (= SDx pin, serial data input and output) signal lines. Both lines are connected to V_{DDIO} externally via pull-up resistors so that they are pulled high when the bus is free.

The I²C interface of the BNO055 is compatible with the I²C Specification UM10204 Rev. 03 (19 June 2007), available at http://www.nxp.com. The BNO055 supports I²C standard mode and fast mode, only 7-bit address mode is supported. The BNO055 I²C interface uses clock stretching.

The default I²C address of the BNO055 device is 0101001b (0x29). The alternative address 0101000b (0x28), in I2C mode the input pin COM3 can be used to select between the primary and alternative I2C address as shown in Table 4-7.

Table 4-7: I2C address selection

I2C configuration	COM3_state	I2C address
Slave	HIGH	0x29
Slave	LOW	0x28
HID-I2C	X	0x40

The timing specification for I²C of the BNO055 is given in Table 4-8: I²C timings:

Table 4-8: I²C timings

Parameter	Symbol	Condition	Min	Max	Units
Clock Frequency	f_{SCL}			400	kHz
SCL Low Period	t_{LOW}		1.3		µs
SCL High Period	t_{HIGH}		0.6		
SDA Setup Time	t_{SUDAT}		0.1		
SDA Hold Time	t_{HDDAT}		0.0		
Setup Time for a repeated Start Condition	t_{SUSTA}		0.6		
Hold Time for a Start Condition	t_{HDSTA}		0.6		
Setup Time for a Stop Condition	t_{SUSTO}		0.6		
Time before a new Transmission can start	t_{BUF}		1.3		
Idle time between write accesses, normal mode, standby mode, low-power mode 2	$t_{IDLE\_wacc\_nm}$		2		µs
Idle time between write accesses, suspend mode, low-power mode 1	$t_{IDLE\_wacc\_sum}$		450		µs

Figure 5: I²C timing diagram shows the definition of the I²C timings given in Table 4-8:
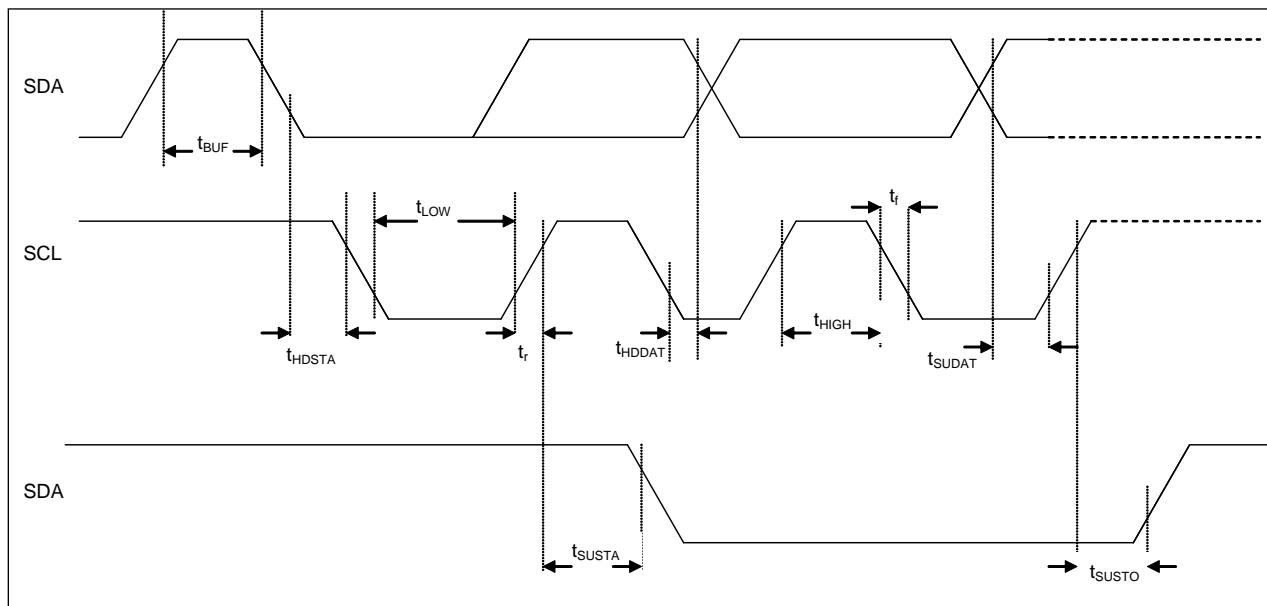

Figure 5: I²C timing diagram

The I²C protocol works as follows:

START: Data transmission on the bus begins with a high to low transition on the SDA line while SCL is held high (start condition (S) indicated by I²C bus master). Once the START signal is transferred by the master, the bus is considered busy.

STOP: Each data transfer should be terminated by a Stop signal (P) generated by master. The STOP condition is a low to HIGH transition on SDA line while SCL is held high.

ACK: Each byte of data transferred must be acknowledged. It is indicated by an acknowledge bit sent by the receiver. The transmitter must release the SDA line (no pull down) during the acknowledge pulse while the receiver must then pull the SDA line low so that it remains stable low during the high period of the acknowledge clock cycle.

In the following diagrams these abbreviations are used:

S   Start
P   Stop
ACKS   Acknowledge by slave
ACKM   Acknowledge by master
NACKM   Not acknowledge by master
RW   Read / Write

A START immediately followed by a STOP (without SCL toggling from ´VDDIO´ to ´GND´) is not supported. If such a combination occurs, the STOP is not recognized by the device.

I²C write access:
I²C write access can be used to write a data byte in one sequence. The sequence begins with start condition generated by the master, followed by 7 bits slave address and a write bit (RW = 0). The slave sends an acknowledge bit (ACK = 0) and releases the bus. Then the master

sends the one byte register address. The slave again acknowledges the transmission and waits for the 8 bits of data which shall be written to the specified register address. After the slave acknowledges the data byte, the master generates a stop signal and terminates the writing protocol.

Example of an I²C write access to the BNO055 (i2c address in this case: 0101000b = 0x28):

Start	Slave address								RW	ACKS	dummy	Register address (0x00 .. 0x7F)								ACKS	Data								ACKS	Stop
S	0	1	0	1	0	0	0	0	0	A	x	x	x	x	x	x	x	x	A	x	x	x	x	x	x	x	x	A	P

Figure 6: I²C write

I²C read access:
I²C read access also can be used to read one or multiple data bytes in one sequence. A read sequence consists of a one-byte I²C write phase followed by the I²C read phase. The two parts of the transmission must be separated by a repeated start condition (Sr). The I²C write phase addresses the slave and sends the register address to be read. After slave acknowledges the transmission, the master generates again a start condition and sends the slave address together with a read bit (RW = 1). Then the master releases the bus and waits for the data bytes to be read out from slave. After each data byte the master has to generate an acknowledge bit (ACK = 0) to enable further data transfer. A NACKM (ACK = 1) from the master stops the data being transferred from the slave. The slave releases the bus so that the master can generate a STOP condition and terminate the transmission.
The register address is automatically incremented and, therefore, more than one byte can be sequentially read out. Once a new data read transmission starts, the start address will be set to the register address specified in the latest I²C write command. By default the start address is set at 0x00. In this way repetitive multi-bytes reads from the same starting address are possible.

Example of an I²C read access to the BNO055:

Start	Slave address								RW	ACKS	dummy	Register address (0x08)								ACKS
S	0	1	0	1	0	0	0	0	0	A	x	0	0	0	1	0	0	0	A

Start	Slave address								RW	ACKS	Read data (0x08)								ACKM	Read data (0x09)								ACKM	
Sr	0	1	0	1	0	0	0	1	A	x	x	x	x	x	x	x	x	A	x	x	x	x	x	x	x	x	A	...

	ACKS	Read data (0x0A)								ACKM	Read data (0x0B)								ACKM	
...	A	x	x	x	x	x	x	x	x	A	x	x	x	x	x	x	x	x	A	...

	ACKS	Read data (0x0C)								ACKM	Read data (0x0D)								NACKM	Stop
...	A	x	x	x	x	x	x	x	x	A	x	x	x	x	x	x	x	x	NA	P

Figure 7: I²C multiple read

4.7 UART Protocol

The BNO055 supports UART interface with the following settings: 115200 bps, 8N1 (8 data bits, no parity bit, one stop bit). The maximum length support for read and write is 128 Byte. The packet structure for register read and write are described below.

Register write

Command:

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	.....	Byte (n+4)
Start Byte	Write	Reg addr	Length	Data 1	.....	Data n
0xAA	0x00	<..>	<..>	<..>	.....	<..>

Acknowledge Response:

Byte 1	Byte 2
Response Header	Status
0xEE	0x01: WRITE_SUCCESS 0x03: WRITE_FAIL 0x04: REGMAP_INVALID_ADDRESS 0x05: REGMAP_WRITE_DISABLED 0x06: WRONG_START_BYTE 0x07: BUS_OVER_RUN_ERROR 0X08: MAX_LENGTH_ERROR 0x09: MIN_LENGTH_ERROR 0x0A: RECEIVE_CHARACTER_TIMEOUT

Register read

Command:

Byte 1	Byte 2	Byte 2	Byte 3
Start Byte	Read	Reg addr	Length
0xAA	0x01	<..>	<..>

Read Success Response:

Byte 1	Byte 2	Byte 3	.....	Byte (n+2)
ResponseByte	length	Data 1	.....	Data n
0xBB	<..>			

Read Failure or Acknowledge Response:

Byte 1	Byte 2
Response Header	Status
0xEE	0x02: READ_FAIL 0x04: REGMAP_INVALID_ADDRESS 0x05: REGMAP_WRITE_DISABLED 0x06: WRONG_START_BYTE 0x07: BUS_OVER_RUN_ERROR 0X08: MAX_LENGTH_ERROR 0x09: MIN_LENGTH_ERROR 0x0A: RECEIVE_CHARACTER_TIMEOUT

Limitation:

- The command is rejected and no acknowledgement is sent when an invalid start byte is sent. The maximum character timeout is 30ms when receiving successive characters.

4.8 HID over I2C

HID over I2C is a standard interface protocol to connect devices with hosts via I2C. The main advantage of HID is that there exist generic drivers for different input devices (such as sensors) which can be used with sensors that implement the corresponding well defined HID profiles. HID over I2C describes how messages (reports and events) are exchanged between the device and the host. A descriptor of the structure of these reports is provided by the device and read by the host during initialization of the device at host system start.

For detailed information on HID please refer to the HID over I2C documentation from Microsoft.

5. **Pin-out and connection diagram**

5.1 Pin-out

The pin-out of the LGA package is shown in Figure 8 and the pin function is described in Table 5-1.

Figure 8: Pin-out bottom view
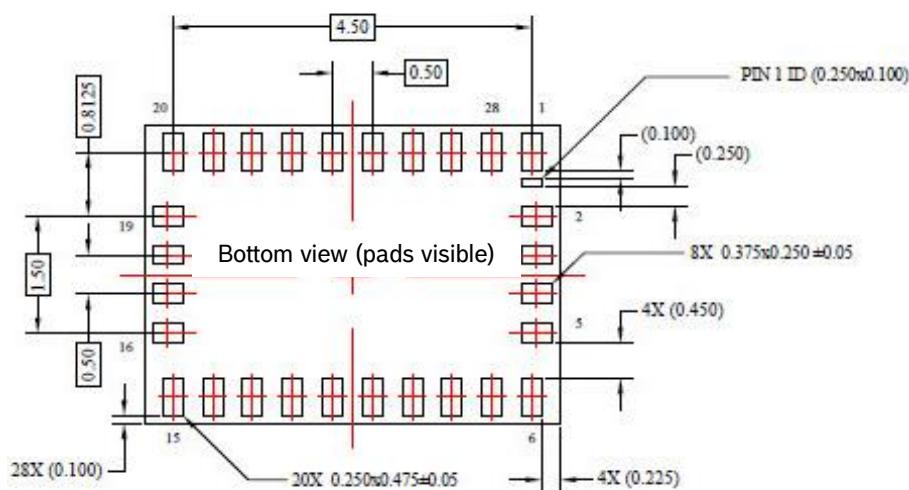

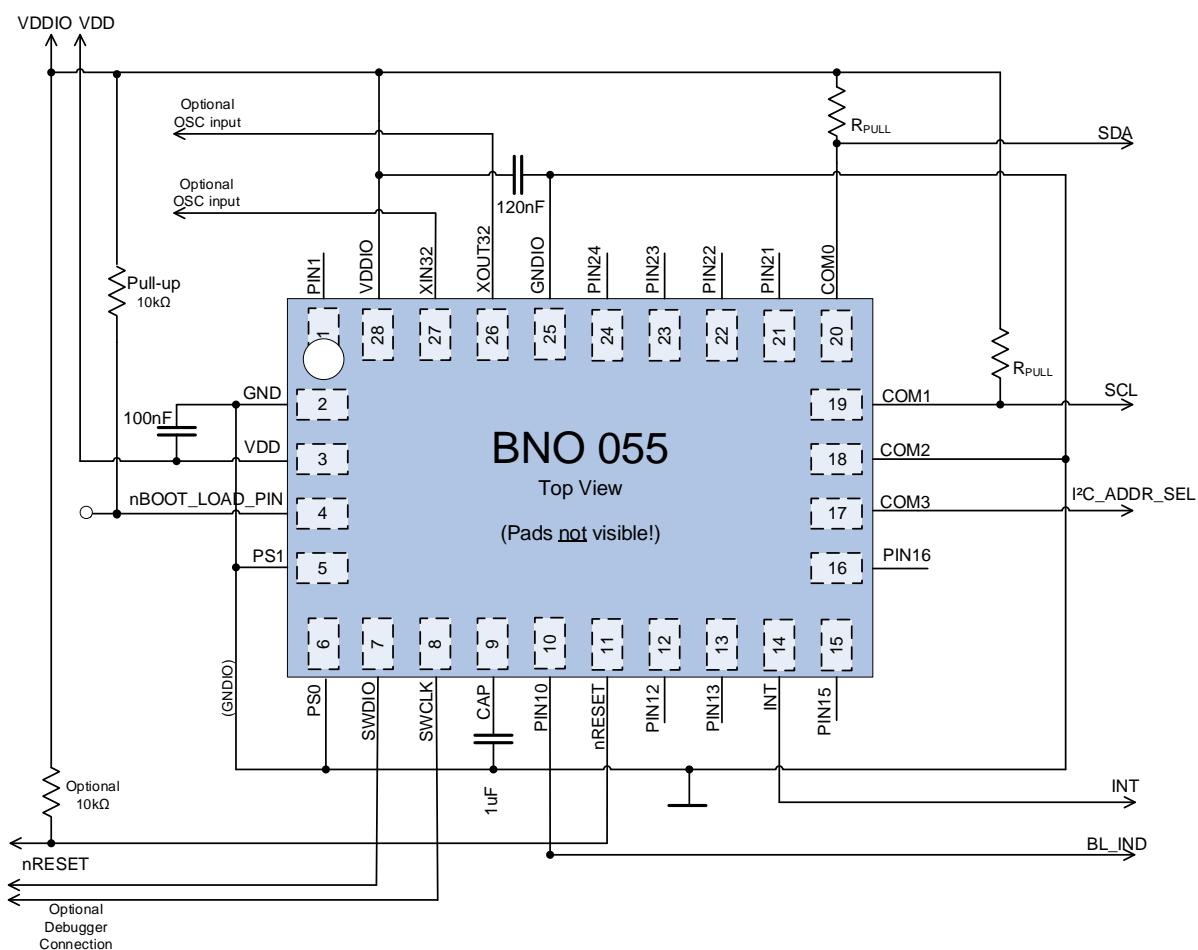

Table 5-1: Pin description

| Pin #	Name	I/O Type	Description	Function

5.2 Connection diagram I²C
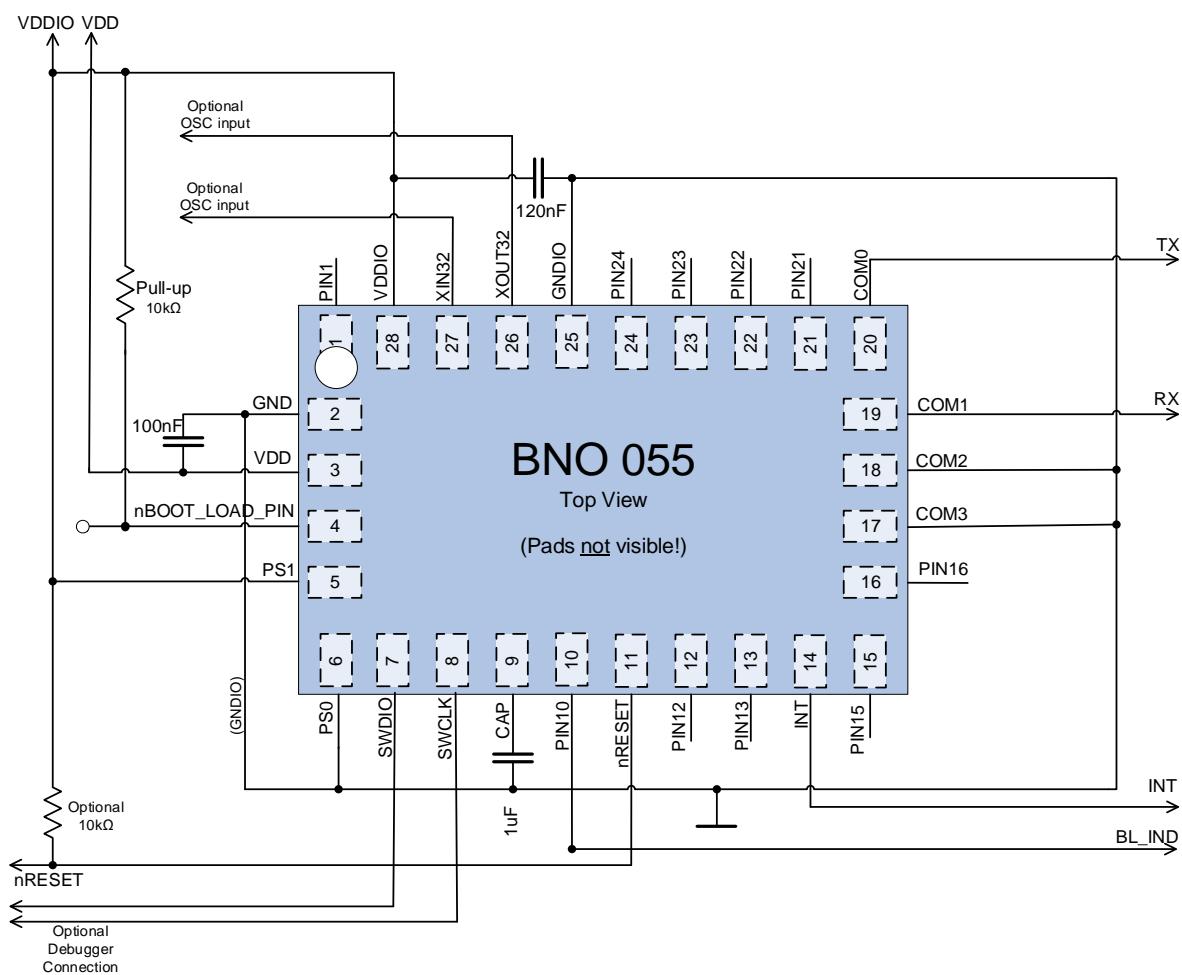

Figure 9: I²C connection diagram

5.3 Connection diagram UART
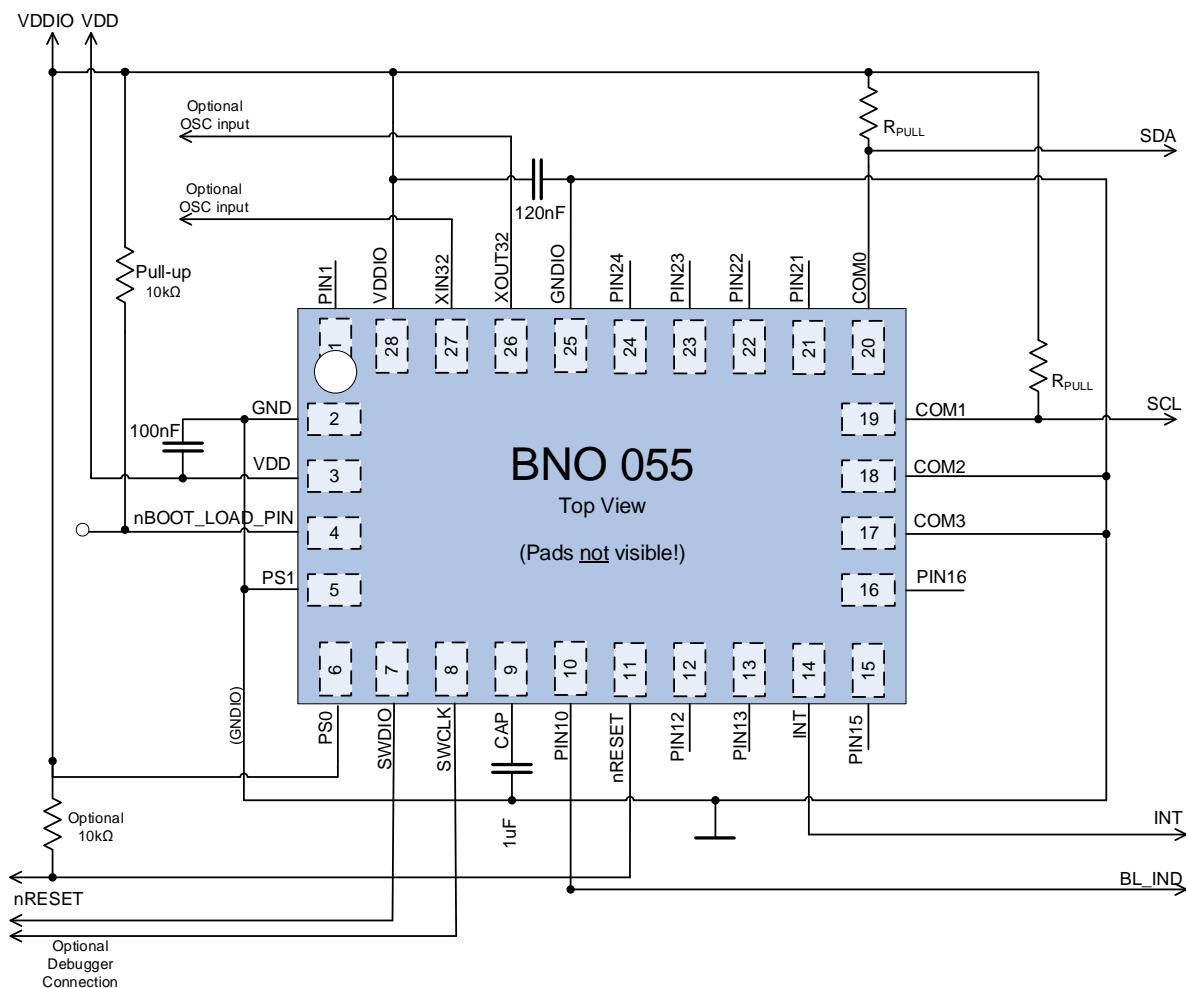

Figure 10: UART connection diagram

5.4 Connection diagram HID-I2C

Figure 11 : HID via IC connection diagram

5.5 XOUT32 & XIN32 Connections

The BNO055 can run from an internal or external 32 KHz clock source. By default, the internal clock is selected.

An External clock can be selected by setting bit CLK_SEL in the SYS_TRIGGER register. It is recommended to only trigger the clock selection in config mode. An external 32 KHz crystal oscillator has to be connected to the pins XIN32 and XOUT32 as shown below.

To get the best performance out of BNO055, it is recommended to use the external crystal.

The typical 32KHz crystal voltage amplitude to be around 500-700mV.

5.5.1 External 32kHz Crystal Oscillator

Figure 12 : External 32kHz Crystal Oscillator with Load Capacitor
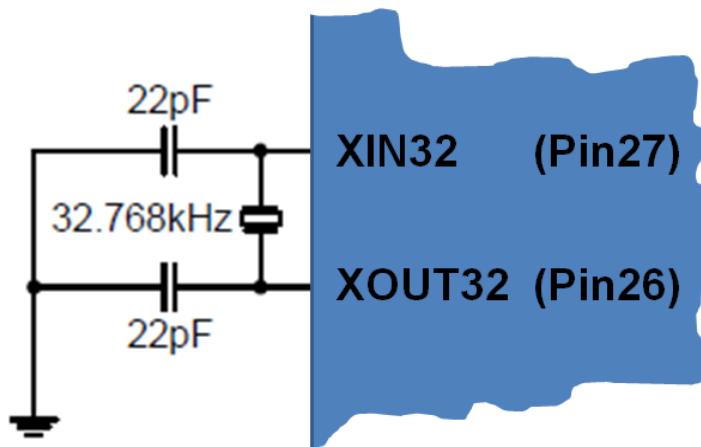

Table 5-2: Crystal Oscillator Source Connections

Pin Name	Recommended Pin Connection	Description
XIN32	Load capacitor 22pF[910]	Timer oscillator input
XOUT32	Load capacitor 22pF[910]	Timer oscillator output

When switching to the external clock source, the BNO055 will check for integrity of the crystal's signal. In case of improper signal (e.g. crystal damaged, broken/missing…), the BNO055 will automatically switch back to its internal clock source and clear the CLK_SEL bit in SYS_TRIGGER register.

It takes minimum ~600ms to configure the external crystal and startup the BNO055.

How to detect the external crystal is started and running:
- Poll the bit ST_MAIN_CLK in the register SYS_CLK_STATUS till it becomes cleared.

---

[9] These values are given only as typical example.

[10] Decoupling capacitor should be placed close to the device for each supply pin pair in the signal group.

- Then read the bit CLK_SEL in the register SYS_TRIGGER which will be set if external crystal is configured successfully otherwise the internal crystal is configured and CLK_SEL bit is cleared due to some error with external crystal.

5.5.2 Internal clock mode

The internal clock can be selected by clearing bit CLK_SEL in the SYSTEM_TRIGGER register. When an internal clock is used, both pins XIN32 and XOUT32 can be left open. The internal clock of the BNO055 can have clock deviation up to $\pm3\%$

6. **Package**

6.1 Outline dimensions

The sensor package is a standard LGA package; dimensions are shown in the following diagram. Units are in mm. Note: Unless otherwise specified tolerance = decimal ±0.1mm. The chapter 3.4 provides information regarding the sensor axis orientation.

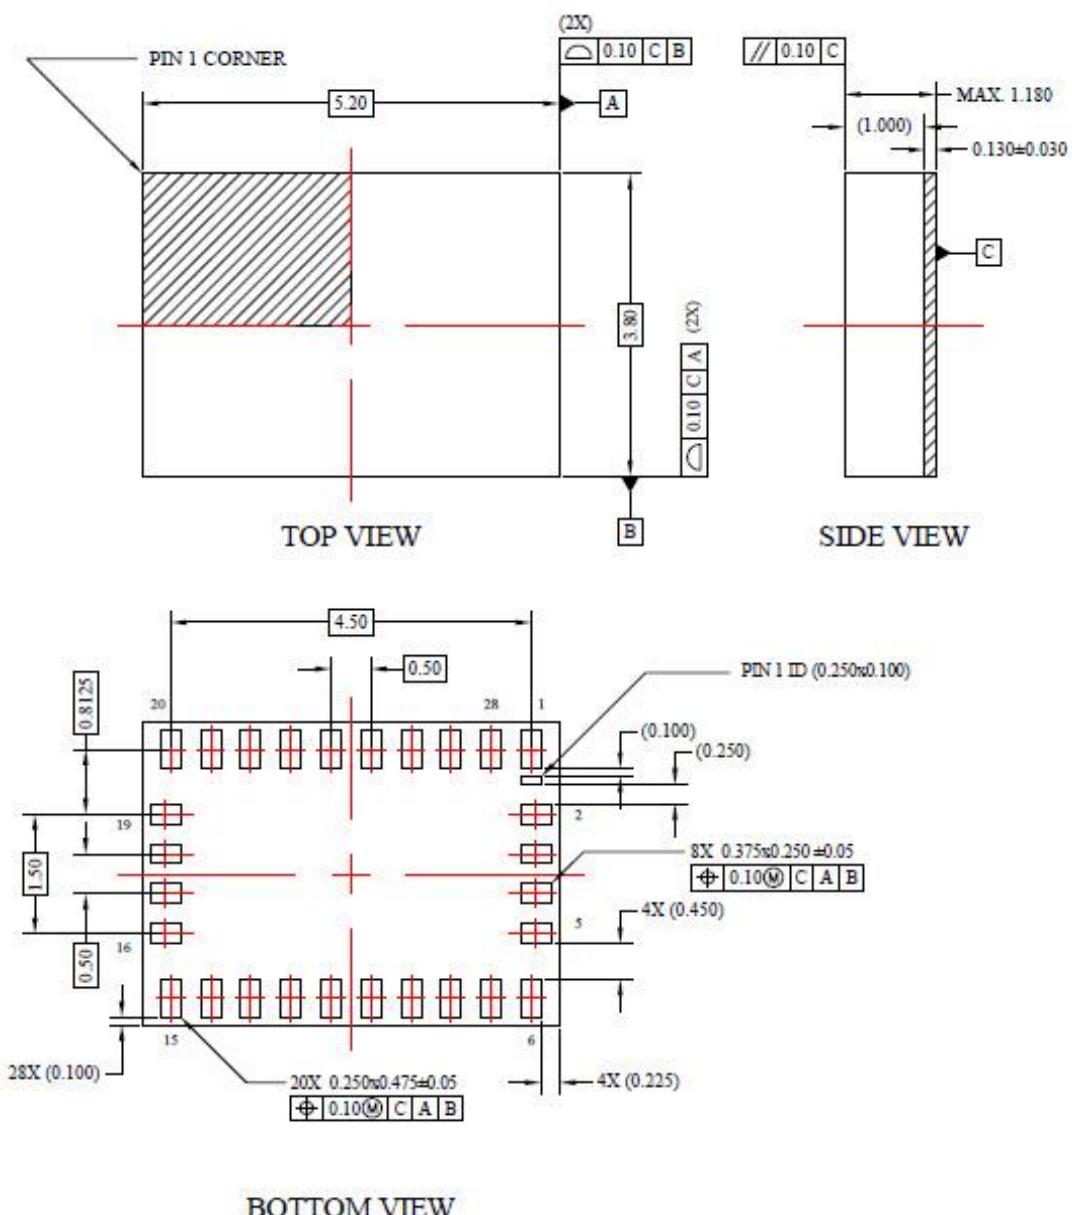

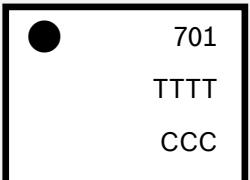

Figure 13: Outline dimensions

6.2 Marking

Table 6-1: Marking of mass production parts

Labeling	Name	Symbol	Remark
● 701 TTTT CCC	Pin 1 identifier	●	---
	Product number	701	3 numeric digits, internal identification for product type
	Second Row	T	Internal use
	Third Row	C	Numerical counter

6.3 Soldering Guidelines

The moisture sensitivity level of the BNO055 sensors corresponds to JEDEC Level 1, see also

- IPC/JEDEC J-STD-020E   "Joint Industry Standard: Moisture/Reflow Sensitivity Classification for non-hermetic Solid State Surface Mount Devices"
- IPC/JEDEC J-STD-033D "Joint Industry Standard: Handling, Packing, Shipping and Use of Moisture/Reflow Sensitive Surface Mount Devices"

The sensor fulfils the lead-free soldering requirements of the above-mentioned IPC/JEDEC standard, i.e. reflow soldering with a peak temperature up to 260°C.

6.4 Handling instructions

Micromechanical sensors are designed to sense acceleration with high accuracy even at low amplitudes and contain highly sensitive structures inside the sensor element. The MEMS sensor can tolerate mechanical shocks up to several thousand g's. However, these limits might be exceeded in conditions with extreme shock loads such as e.g. hammer blow on or next to the sensor, dropping of the sensor onto hard surfaces etc.

We recommend avoiding g-forces beyond the specified limits during transport, handling and mounting of the sensors in a defined and qualified installation process.

This device has built-in protections against high electrostatic discharges or electric fields (e.g. 2kV HBM); however, anti-static precautions should be taken as for any other CMOS component. Unless otherwise specified, proper operation can only occur when all terminal voltages are kept within the supply voltage range. Unused inputs must always be tied to a defined logic voltage level.

For more details on recommended handling, soldering and mounting please contact your local Bosch Sensortec sales representative and ask for the "Handling, soldering and mounting instructions" document.

6.5 Tape and reel specification

The BNO055 is shipped in a standard cardboard box. For details please refer to the 'Shipment packaging details' document.

6.6 Environmental safety

The BNO055 sensor meets the requirements of the EC restriction of hazardous substances (RoHS, RoHS2 and RoHS3) directive, see also:

Directive 2015/863/EU on the restriction of the use of certain hazardous substances in electrical and electronic equipment.

6.6.1 Halogen content

The BNO055 is halogen-free. For more details on the analysis results please contact your Bosch Sensortec representative.

6.6.2 Internal package structure

Within the scope of Bosch Sensortec's ambition to improve its products and secure the mass product supply, Bosch Sensortec qualifies additional sources (e.g. 2nd source) for the LGA package of the BNO055.

While Bosch Sensortec took care that all of the technical packages parameters are described above are 100% identical for all sources, there can be differences in the chemical content and the internal structural between the different package sources.

However, as secured by the extensive product qualification process of Bosch Sensortec, this has no impact to the usage or to the quality of the BNO55 product.

7. Legal disclaimer

7.1 Engineering samples

Engineering Samples are marked with an asterisk (*) or (e). Samples may vary from the valid technical specifications of the product series contained in this data sheet. They are therefore not intended or fit for resale to third parties or for use in end products. Their sole purpose is internal client testing. The testing of an engineering sample may in no way replace the testing of a product series. Bosch Sensortec assumes no liability for the use of engineering samples. The Purchaser shall indemnify Bosch Sensortec from all claims arising from the use of engineering samples.

7.2 Product use

Bosch Sensortec products are developed for the consumer goods industry. They may only be used within the parameters of this product data sheet. They are not fit for use in life-sustaining or safety-critical systems. Safety-critical systems are those for which a malfunction is expected to lead to bodily harm, death or severe property damage. In addition, they shall not be used directly or indirectly for military purposes (including but not limited to nuclear, chemical or biological proliferation of weapons or development of missile technology), nuclear power, deep sea or space applications (including but not limited to satellite technology).

The resale and/or use of Bosch Sensortec products are at the purchaser's own risk and his own responsibility. The examination of fitness for the intended use is the sole responsibility of the purchaser.

The purchaser shall indemnify Bosch Sensortec from all third party claims arising from any product use not covered by the parameters of this product data sheet or not approved by Bosch Sensortec and reimburse Bosch Sensortec for all costs in connection with such claims.

The purchaser accepts the responsibility to monitor the market for the purchased products, particularly with regard to product safety, and to inform Bosch Sensortec without delay of all safety-critical incidents.

7.3 Application examples and hints

With respect to any examples or hints given herein, any typical values stated herein and/or any information regarding the application of the device, Bosch Sensortec hereby disclaims any and all warranties and liabilities of any kind, including without limitation warranties of non-infringement of intellectual property rights or copyrights of any third party. The information given in this document shall in no event be regarded as a guarantee of conditions or characteristics. They are provided for illustrative purposes only and no evaluation regarding infringement of intellectual property rights or copyrights or regarding functionality, performance or error has been made.

8. Document history and modifications

Rev. No	Chapter	Description of modification/changes	Date
0.1		Initial version	2013-09-02
0.2		Completely revised version (BMF055 added)	2013-10-15
0.9		Preliminary version with feature set of Firmware version 0.2.B.0	2014-04-25
1.0		Complete review	2014-07-11
1.1	3	Rearrangement of subsections in chapter 3 for better readability.	2014-11-05
	3.3	Table 3.1 is updated for better readability and all the operation modes are elaborated	
	3.11	Chapter on calibration included	
	3.7, 3.10	Update	
	4.2	The default value of the UNIT_SEL register is updated	
	4.6	I2C communication example figures are updated.	
	5.1, 5.2, 5.3, 5.4	Included table 5.1 Pin description. Connection diagram updated	
1.2	5	Updated pin description and connection diagram	2014-11-30
	6.1	Updated outline dimensions	
	6.2	Chapter removed and the respective information is updated in the Handling, soldering and mounting instructions application note.	
1.3	1.1	Supply current in low power mode is updated	2015-08-19
	1.2	Table 0-2 is updated for POR time description	
	3.5	Accelerometer restrictions updated in table 3.8	
	3.7	New section called 'Data Register Shadowing' is included to explain the concept shadowing	
	4.4.15	The SMNM bit field for Slow motion and no motion updated in the register description	
1.4	1.1	Representation of voltage in the table 0-1 is updated	2016-06-02
	2	The max value for ESD is updated	
	4.4.6	ACC_Sleep_Config register is updated for Accelerometer Sleep Phase Duration	
	5.1	Table 5-1: Pin description together with all the 3 connection diagrams are updated.	
1.5	2	Removed preliminary wording	2019-07-30
	3.2	Added recommendation to avoid invalid power mode	
	3.3.3	Added notes on sensor fusion limitations	
	3.5.1	Clarified sensor config is only available in non-fusion mode	
	3.6.1	Minor corrections to units	
	3.6.4.1 3.6.4.3 3.6.4.4	Changed offset range definition	
	3.6.4.4	Minor corrections	
	3.6.5.6	Added note on integration	
	3.8.2.1	Added Data Ready interrupt	
	3.9.2	Updated Self-test result readout	

	3.11.4, 4	Added Soft-Iron calibration description	
	4.2.1	-Updated default values -Aded Data-Ready interrupt -Fixed minor mistakes -update pre-programmed software revision to 3.11	
	4.3.x	Added missing default values	
	5.5	Added more information on external crystal	
	7	Legal disclaimer update	
1.6	5.1 5.2, 5.3, 5.4	- Updated recommendation for pin 15 and 16 - Added SWD interface description for debugger - Updated connection diagrams	2020-02-19
